At the inaugural luncheon of the show, Lord Bledisloe, president of the association, said that this year's show had never been equalled, not merely in the quantity of the exhibits, but in quality. The cattle exhibits, he thought, would be regarded by experts as the finest collection in one building of dairy cattle that had ever been seen in this country. "There was no branch of the agricultural industry," continued Lord Bledisloe, "in which there had been more progress made during the last 45 years than dairying. In spite of the melancholy wails of certain gentlemen who occasionally contributed to the public press that there was poison in the milk pail, it is more important to the health of the community, and particularly the poorer section of the community and their children, that there should be a plentiful supply of milk than that there should be milk which from a bacteriological point of view was absolutely above criticism." Some of the leading medical men at the recent conference on tuberculosis drew attention to the fact that a certain section of the public were being deterred from consuming sufficient milk for themselves and their children by these alarming reports about disease carried by the milk supply. He agreed that they must all try to improve their methods. There was scope for considerable improvement in the matter of cleanliness in the production, carriage, and distribution of milk, but the milk being consumed by the British public today was infinitely better and more free from disease, both bovine and human, than the milk consumed in this country a generation ago.

As a result of the milk recording tests which, fortunately, were coming more and more into use, they found at

Winter Profits from Dairy Cows

Winter Profits from dairy cows depend upon the economy of winter feeding. Economical feeding in this case does not mean feeding a small amount of feed, nor does it mean feeding the cheapest feed obtainable. It means that combination of feeds that will produce the most profitable results at the least cost.

True Value

True Value Dairy Feed is a combination of those nutrients which the dairy cow can most **profitably** transform into bodily maintenance and milk. The cow uses the energy received from the feed **first** for bodily needs and **then** produces milk from the balance. Some nutrients can be used most profitably for body maintenance and others for milk production. Hence, it is absolutely necessary to have the **exact balance** of nutrients to make the most profit.

In True Value Dairy Feed we have combined **only** those nutrients which the Dairy Cow can convert into vital energy and milk **at a profit.** The profitable cow will not fatten on True Value Dairy feed but she will maintain her **highest** standard of bodily vigor — produce her maximum amount of milk — and return the **greatest** profit on the **money** invested.

True Value Stock Feed like True Value Dairy Feed is a profit making feed. It is designed first of all for young stock. That is, it will furnish energy for plenty of rapid growth and development and still not fatten. Because the nutrients in True Value Stock Feed are directly available for use, the development of young stock is made at a wonderful profit.

True Value Stock Feed forms the base for a very profitable dairy ration when used in combination with silage, ground corn or oats and oil meal or cottonseed meal.

Ask your dealer for True Value Feeds. If he cannot supply you write us.

Westclox

Baby Ben will slip snugly even into small stockings

BABY BEN does his work with a smile—and gets you up the same way. Not so easy sometimes, either, on those cold, dark mornings when you'd a lot rather stay in bed for another little roll-over nap.

Maybe it's his littleness that gets him so many friends: folks chum up with Baby Ben on sight. But he's a lot more than just cute! Otherwise his friendships wouldn't last.

He's a good timekeeper and a dependable alarm—true to the Westclox reputation.

Baby Ben will call you once with a long ring or he'll coax you gently out of bed with intermittent calls—any way you say.

He's just about as big as a minute but he takes every minute seriously—as a good timekeeper should.

That Westclox construction inside his case is what helps him make good. The name, Westclox, on the dial and tag *always* means Westclox patented construction; and honest, faithful timekeeping.

Of Vital Interest to All Dairy Women

H. S. K. WILLCOX, NEW YORK

THE millions of new American voters are some day going to vote for and have enacted laws which the regular voters in this country have overlooked and passed by until shamed out of their indifference by their own wives, mothers, and sisters. One of the greatest of these vitally needed pieces of legislation is about to wage a grim battle for its passage, and its future existence and power seems to depend at this writing on the earnest help of American women. That bill to come up for the consideration of Congress in December is called the Sheppard-Towner bill and it provides for the very material lessening of the casualties of American motherhood. Surely every farm woman in our United States should manifest interest and concern at this announcement, especially those of us in isolated districts or far from the advice and medical attendance which might save a life at the most critical time in any woman's span.

Good Housekeeping Magazine is making its mighty influence felt for the immediate passage of this bill and from its columns I would gather the facts which every woman everywhere should know if she is to throw her influence in time for a law which will make her life and that of her baby nearly as well worth the saving in the opinion of Congress as the lives of her husband's hogs, sheep, cows, and horses.

It will come as a shock to the average decent American man and his faithful partner to learn that the casualties of war and the casualties of motherhood nearly balance. Our own casualties in the world war were 34,625 killed in action, while during the same period, 30,000 American mothers died in childbirth.

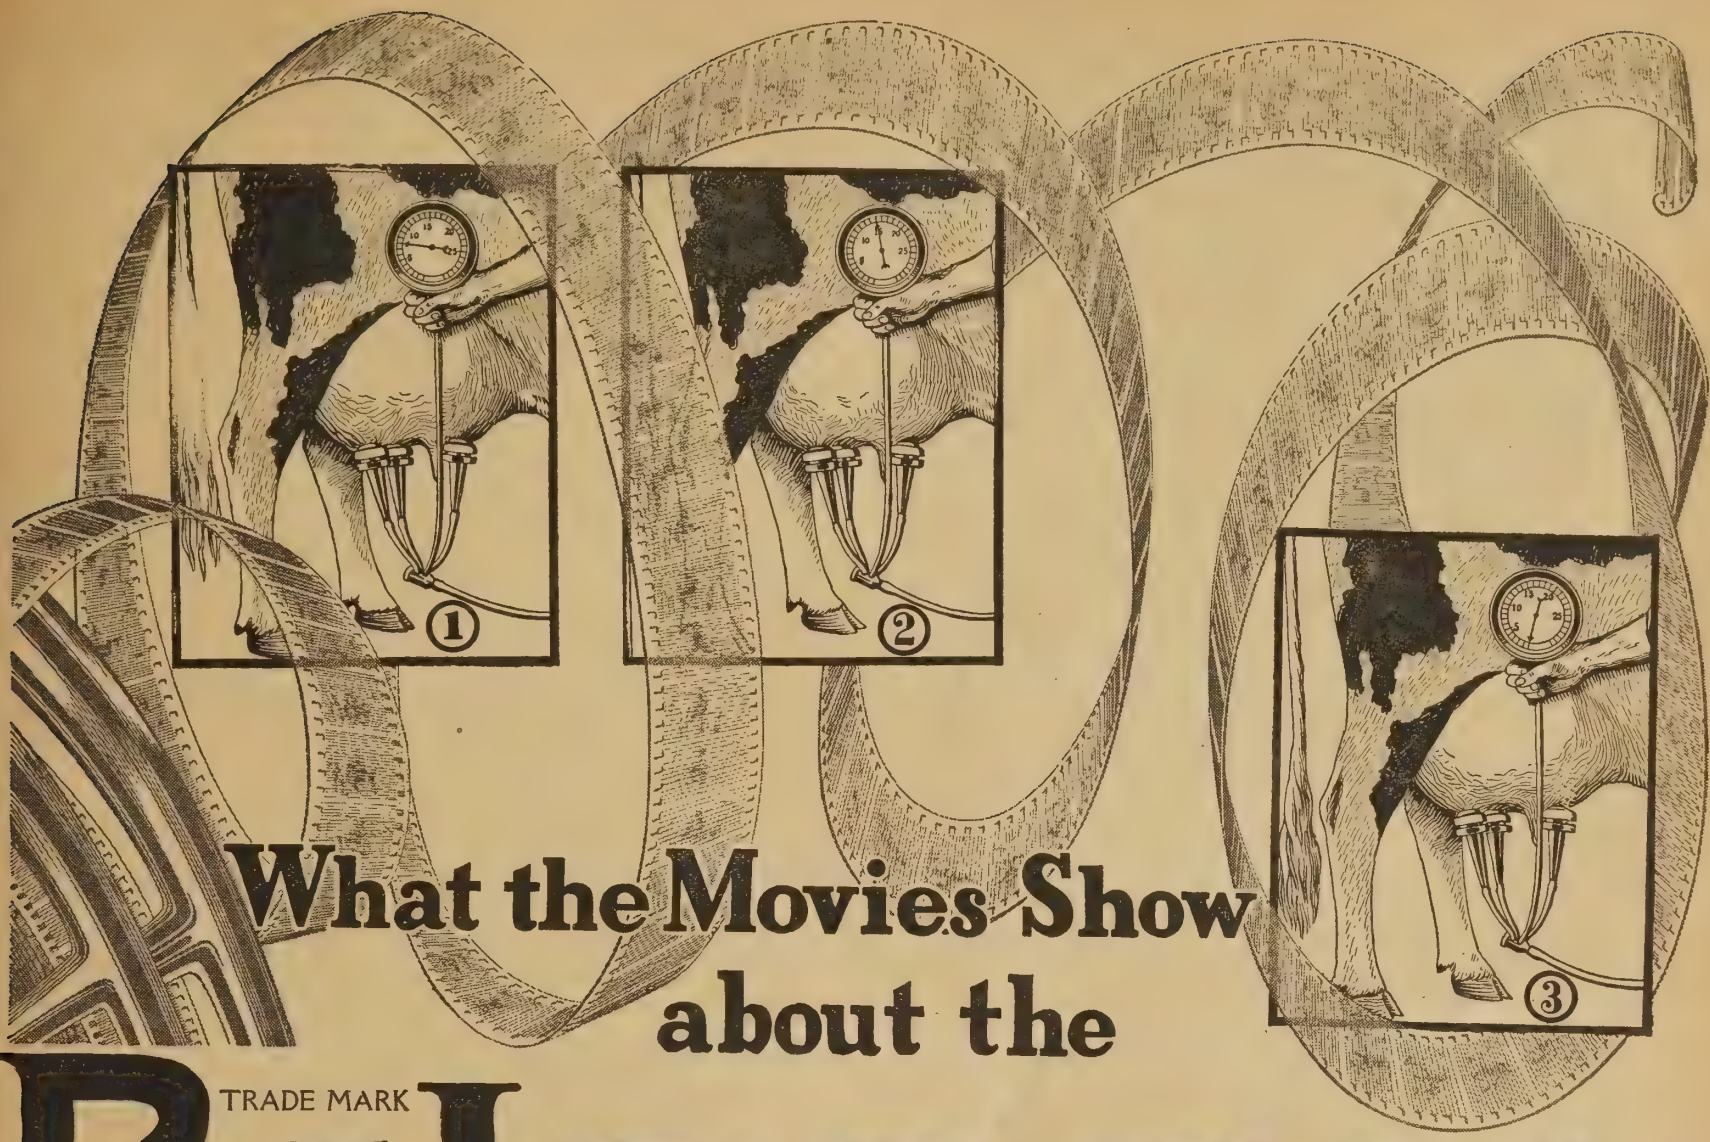
Every year in the United States more than two million women submit themselves to a contest with death in bringing children into the world. These figures are repeated year in and year out—in war or peace—and women accept the burden and many of them call it their happiness. Casualities of war are accurately recorded and scientifically treated under government responsibility, but the casualties of motherhood are casual, indeed, says Good Housekeeping, and it is considered as a mere matter of course for which there is none but individual responsibility, and no care and treatment beyond that afforded by the family purse. To the meagre purse may be traced many of the fatalities and injuries that help swell the shameful total of deaths from this cause.

For the casualties of war the government provides free surgical care of the most expert, experienced, and scientific kind. It assumes no responsibility for the bringing into the world of its future citizens. Mothers must pay their own surgical care, and we know too well that only a very small proportion who need such care can afford it, and those living on isolated ranches and farms fight the battle of childbirth with little or no help from trained sources—and accept the life or death verdict with a courage glorious and sublimely pathetic in its unselfishness.

It is safer to become a mother in many other countries than in the rich and progressive United States. Of fifteen important countries, fourteen have a more favorable maternal death rate than ours, and seven a more favorable infant mortality rate.

The Children's Bureau, from the point of view of human welfare perhaps the most important bureau of the national government, and yet receiving the most meagre of aid, found that the menace to childhood begins at the darkest hour of the mother's life—when she brings her child into the world. It found that the person most strangely neglected by medicine is the helpless mother at that hour, and that by neglect alone the child and mother cruelly suffer. It found that 80 per cent of the mothers in rural districts had received no advice or trained care during pregnancy and that many mothers had no trained care whatever at confinement.

This bureau found that not only 23,000 American mothers die each year at confinement, but that within the first year of life and from causes going back to pregnancy, childbirth, or poor care or lack of any immediately following, 250,000 babies die each year, 40 per cent of them in the first month of life. This is a total of deaths alone, leaving out of account all injuries not fatal, which is larger for twelve months than the total of American men, both killed and wounded, during the nineteen months of the war.



Investigation also proved that in the past fifty years there has been no diminution in the number of deaths of mothers in childbirth and that more women die at this time, leaving the new born babe motherless, than from any other cause, even tuberculosis. This is a pretty serious charge to bring against medical science. That it is possible to make such a statement is due to the fact that the medical profession, disregarding its casualties, has always persisted in considering childbirth not as a pathological but as a perfectly normal physiological process.

Three years ago the Children's Bureau framed a bill for the purpose of bringing to it the aid of the federal government. It provided that the government should give financial aid to the states in taking up this new aspect of public health—the care of women and children at childbirth. By its terms, federal and state governments would co-operate in providing instruction for mothers in the hygiene of infancy and maternity through public health nurses, consultation centers, and other methods, and would also provide medical attention and nursing care in home or hospital where necessary. Special mention was made of those in isolated places. The bill was introduced in Congress by Representative Jeanette Rankin.

Of vital interest to all women, but of little seeming importance to men and with no men interested outside of Congress to bring the pressure of their vote to bear, this measure for the benefit of present and future generations never even came to a vote. In 1920 a change has come to pass. Women now hold government power fairly equal to men. The Maternity Bill has been introduced in both Houses by Senator Morris Sheppard of Texas and Representative Horace Towner of Iowa.

The Sheppard-Towner Bill considers babies as the Smith-Lever law considers farm animals. Under the latter law the federal government is today wonderfully aiding the agricultural development of this country. In the same way the Sheppard-Towner bill seeks to develop human welfare. It will provide that the United States appropriate to the states for infant and maternity hygiene a certain sum, with the requirement that an equal amount be appropriated by the public

What the Movies Show about the

TRADE MARK BURRELL B-L-K MILKER

THE MOVIE camera has caught the story of the Burrell Automatic Controller and shows why the Burrell Milker *"Milks the Cows Clean."* The illustrations shown above are taken from the film of a moving picture of the Burrell Milker in actual operation. They are selected to show the suction on the teats at three distinct periods in the process of milking.

In picture No. 1, taken during the main part of the milking, when the milk was flowing freely, the gauge registered eight inches—only about one-half the maximum suction.

In picture No. 2, taken toward the end of the milking, when the milk was flowing less freely, the gauge registered fifteen inches—the maximum suction.

These moving pictures demonstrate the efficiency with which the Burrell Automatic Controller regulates the suction to the requirements of the cow at different stages of the milking, and to the requirements of different cows.

During the main part of the milking or at the end of the milking—on easy milkers or on hard milkers—the Burrell always gives the right suction. There is a constant *balance* between the amount of milk flowing and the amount of suction on the teat.

In picture No. 3, taken between sucks, the gauge registers zero, showing how the Burrell Pulsator creates sharp, definite, positive, intermittent periods of relief during which the teat hangs in free air, and normal circulation is resumed.

Write for booklets and complete information about the Burrell Milker. Tell us how many cows you have and why you are not already milking by machine. Use the coupon below.

Washington, D. C., Weekly News

[Special to Hoard's Dairyman]

WASHINGTON, DEC. 8—The final session of the 66th Congress opened this week, with the novel circumstance of the president-elect holding his seat in the U. S. Senate.

There is another circumstance which marks the opening of this Congress which is more significant than the presence even of the president-elect of the United States, and that is that important as are the supply bills and the taxation revision program which this Congress is to take up, agricultural legislation holds the center of the stage in both houses. Whether this means constructive and safe legislation depends on a number of other factors, but one factor is sure, between the power and the insistance of agricultural organizations represented in Washington, and the attention which has been directed to agricultural problems by the crisis in prices and in credits, agricultural matters press here for attention to the exclusion of most other matters except supply bills.

⚜

Senate agricultural committee hearings have been in progress for several days, Senator Norris presiding, in an effort to formulate plans for remedial legislation to relieve what is said to be a credit stringency which has forced the products of the farm on the markets. Senator Hitchcock of Nebraska announced the preparation of a bill to furnish federal funds to the land banks to be loaned to farmers through the land bank machinery. Senator Capper has proposed a bill to tax wheat gambling out of existence, especially excepting dealings in hedges and legitimate future trades by licensed dealers, millers, growers, and dealers on recognized boards of trade. A bill to revive the War Finance Corporation to finance foreign trade is proposed. Another measure will compel the Federal Reserve Board to advance money to member banks to finance agricultural loans. A wool embargo bill has been introduced by Senator Smoot. In the House, relief for cotton and wheat growers is proposed in various forms in not less than a score of bills dropped into the box on opening day. Back in the Senate the packer control legislation is "unfinished business" and will be taken up almost as soon as President Wilson finishes reading his final message. But with all this start toward legislation to help the farmers there is nothing certain about what will be done—or that anything will be done. A recess over the holidays is in prospect at an early day, and when the sitting is resumed, supply bills will be ready for consideration, and March 4 is but eight weeks away.

⚜

The problem of foreign trade is up in several forms and interests the dairy industry because of its reaction on the condensed milk situation and because of its secondary reaction on Danish butter imports. There are three foreign trade proposals under discussion, two involving government aid, one purely private. One is the revival of the War Finance Corporation to finance foreign trade shipments by a direct advance of federal funds. One is a direct government loan of a billion dollars to Germany, to be used to buy American foods and raw materials. The third is the organization of Foreign Trade Finance banks, under the Edge law, one having been perfected to handle cotton exports, and one ready for an organization meeting in Chicago, about the time this is printed. Any of the plans, if put into operation, would undoubtedly furnish an outlet for some of the condensed milk now blocking the storehouses and acting as the drag on domestic milk and dairy markets. The loan to Germany if actually granted, would probably, no matter what else it does, supply that nation with raw materials which would start a business revival there which would make Germany a potential consumer of Danish and Holland dairy products, taking them out of American domestic competition.

These and other arguments are being vigorously urged in support of the German loan, which is incorporated in the Smith bill, which was before this Congress just before the end of the last session, and which is to be vigorously revived at this time. The bill is being forced to the front by the campaign in its interest carried on by William Wallace Brauer of New York, the largest live cattle exporter in the United States. Mr. Brauer has wide trade acquaintance throughout the dairy sections of the country. At this time he is the accredited agent of the German Ministry of Finance pressing this bill, and he is in position to guarantee the expenditure of every dollar of the loan in this country, should Congress make the advance. He proposes that this loan shall be a first lien on the resources of the German government, as provided in one article of the Treaty, taking precedence over reparation claims, and also that the entire fund in the hands of the Alien Property custodian, some seven hundred million dollars, shall also be pledged as security for the prompt repayment of the bonds.

Whether or not this form of rehabilitation will be offered our recent enemy, and whether or not such a plan which puts Germany into our markets as a buyer, the result of which might be to establish new price levels, remains to be settled by this Congress as one of the proposed measures of agricultural relief.

⚜

An unofficial list of the 67th Congress membership has been issued by William Tyler Page, Clerk of the House. It shows that 118 new members of the House were chosen on election day. The net result of this survey is to indicate that the friends of agriculture and dairying were for the main part returned. The loss to agricultural interests is greatest in Missouri where two of the men defeated, Congressman Nelson and Congressman Rubey, were outstanding friends of dairying, while Congressman Igoe of St. Louis was a strong supporter of many items of agricultural legislation. In Illinois the defeat of Henry T. Rainey—not the Rainey of Chicago who was also reported to be defeated but whose name appears on the unofficial list—deprives agriculture of a real friend; although it is to be assumed that in this district, as in the 8th and 16th Missouri districts, where farming is the chief industry, the new members will prove to be alert to farmer interests.

⚜

Some time ago the Washington office of the National Dairy Union called attention to a study of text books being carried on, with a view to disclosing whether or not the books in general use in schools and colleges gave proper statement to the essential facts as to vitamines in milk and milk products. It can be stated frankly that this study is very disappointing. It is only the newer books that give any consideration at all to this topic. That the dairy industry should take concerted action to bring this to the attention of text book publishers is the view expressed by the National Dairy Union Secretary, A. M. Loomis, in a statement which he is preparing for the press, to be issued soon. In this statement Secretary Loomis quotes with approval, the statement which he finds in a new text book, "Agriculture for Beginners", issued by Ginn & Co. of New York, in which appears the following statement:

"Along with its dry matter, its protein, its carbohydrates, and its fats, milk and its products possess another most important property. This property is hard to describe for its elements and its powers are not as yet fully understood. However, we do know certainly this much—milk and the foods made from it have power to promote health and favor growth in a more marked degree than any other foods. These health promoting and preserving substances are called "vitamines". Men of science are working with much care to try to add to ou knowledge of these "vitamines", which have so marvelous an influence on the health of all animals. Unless food, no matter how good otherwise, contains these "vitamines"

it does not nourish the body nor preserve bodily health as it should. A complete lack of "vitamines" in our food would cause death. Since, then, milk and its products butter, cheese, curds, are rich in "vitamines", these health giving and health preserving foods should form a regular part of a person's diet."

J. S. Abbott, secretary of the Institute of Independent Margarine Manufacturers, closes what would otherwise be a very valuable and helpful bulletin recently issued on the butter,

T. W. Gullickson, who has resigned his position in the Dairy Division of the United States Department of Agriculture to become instructor in dairying in the University of Minnesota.

margarine, and other edible fat production of the United States, with this statement submitted to the dairy industry as a specimen of the type of mind with which the dairy industry is fighting for its existence: *"The slogan 'down with margaraine' which has been the cry of a few hopelessly envious souls, is insane and without sound economic or scientific basis. It will get them nowhere. It will be a boomerang to those who have used it as soon as the facts of maragarine as a food are known. And they are now being made known."* Unconsciously, perhaps, Mr. Abbott told the truth in the last sentence. The facts of margarine, that it is just as valuable as tallow, or beef fat, and not quite as valuable as lard, and without the vital elements which make butter the incomparable food of all the human family, are just being made known. If to protect the consumer against being sold something of this value as butter, for butter prices, is "insane" than the few "hopelessly envious souls" will be happy to plead guilty to the indictment.

London Dairy Show

(Continued from page 980)

shows an increasing number of cattle of a heavy milking type. There was an imposing display of Friesian cattle at this year's show. Enormous pains were being taken to improve this breed of cattle. We had still within this country British breeds which were comparable almost with any breed on the continent. The Friesians were still on their trial. If they could justify themselves in butter content and in food value to the same extent as they had succeeded in filling the milk pail, they had come to stay and would receive in the future very high recognition from judges of dairy cattle. Dairy Shorthorns, which he thought the majority of farmers in this country considered as still holding the premier position, would have their work cut out to hold their own. He regretted the absence of Ayrshires and South Devons, owing possibly to the cost of railway transit and the coal strike. Ayrshires had made a reputation at any rate for cheesemaking, and were particularly interesting because they led the way in the matter of milk recording.

The differences which existed between milk producers and milk distributors, continued Lord Bledisloe, on the question of winter prices were most unfortunate, and every effort ought to be made to prevent their occurence in future. It was in the best interests of the public that the milk producer and the milk distributor should co-operate without any disputes as to what proportion of profit should be allocated to each. It had been suggested in one district lately that the supply of milk should be curtailed in order to maintain a sufficiently high price during the winter. He could not conceive anything more calculated to stand in the way of the full confidence of the public being extended to the milk producers of the country, and he hoped every dairy farmer would do his best to check any such suggestions among his fellows.

Experiments carried out by Dr. Stenhouse Williams, said Lord Bledisloe, had shown that the great loss entailed every year by the souring of milk could be prevented by proper treatment, whereas 26 per cent of the samples of average milk turned sour within 24 hours from the time of milking, when kept at room temperature.

Small kindnesses, small courtesies, small considerations habitually practised in our social intercourse give a greater charm to the character than the display of great talents and accomplishments.—KELTY.

One Way to Save Feed

A McHenry County (Ill.) herd of 23 grade cows produced $743 worth of milk from $164 worth of Unicorn, fed straight.

Your own grain ration may be getting every pound of milk out of your cows that they can give.

But have you figured feed against milk?

You may be astonished to find that for each dollar you spend for feed you are getting a return of only $2 or $3 in milk.

Where Unicorn is fed, $1 paid for feed brings you a return of $4 or $5 in milk.

Your own ration may be getting the milk, but it is not getting the profit.

Change to Unicorn. Get the same amount of milk, with less money spent for feed. The saving is clear profit.

HOARDS DAIRYMAN JUNIORS

Common Poultry Diseases

Disease is one of the handicaps to successful poultry keeping and should be guarded against at all times. Unless kept in a healthy condition, chicks will not grow properly, and mature fowls will lose their vigor and vitality and become unproductive and unprofitable.

It is far better to prevent disease by proper care and attention than to attempt to cure a bird after it is sick. Therefore it is important to watch the flock closely at all times for any signs of disease, so in case an outbreak occurs it may be checked at once. Prevention is always better than cure, and all boys and girls who wish to succeed in poultry club work should try to give their birds such good care and keep their houses so well cleaned and disinfected that both fowls and chicks will keep hardy and vigorous and allow no opportunity for sickness to creep in.

Some diseases may be treated successfully, while others of a more serious nature usually are fatal. However, if only one or two birds of a flock become sick it is usually advisable to kill them immediately (unless they are choice specimens) and burn or bury the carcasses. If the birds are kept and an attempt is made to doctor or cure them the disease may prove contagious and spread throughout the entire flock.

The more common poultry diseases and those which poultry club members are likely to find most troublesome are gapes (in young chicks), roup, chicken pox, and scaly leg.

Gapes

The disease known as gapes, which is quickly noticed because of the sneezing and gaping of the chick, affects only young chicks and young turkeys, and usually develops during the first few weeks of their lives. It is caused by a little worm which attaches itself to the inside of the windpipe, where after a few days it will increase in numbers to such an extent as to obstruct or stop up the windpipe, making it difficult for the chick to breath, and unless the worms are removed at once it will soon strangle, choke, and die. The female worm produces large quantities of eggs while in the windpipe, and these are thrown out by the chick in sneezing, or are swallowed, pass through the intestines, and are scattered with the droppings. After a few days young worms hatch from these eggs and live in the earth for a long time. If picked up and swallowed by young chicks they quickly find their way to the windpipe, develop, and cause the disease to appear. This explains how infection is carried over from one year to another, and why ground used year after year becomes so infested or filled with these little worms that chicks can not be raised upon it.

TREATMENT—Take a long hair from a horse's tail and twist the two ends together so as to form a loop. Hold the chick's head firmly with one hand, with the neck out straight, forcing the beak open with the fingers. When the glottis, which is the little opening at the root of the tongue, is open for breathing, insert the loop end of the hair, pressing it down the chic's windpipe about 1 inch. Give it two or three turns and then withdraw it. This will usually bring out several of the worms. Make sure that the hair is run down the windpipe and not down the chick's gullet. Each time the hair may be inserted a little deeper until it reaches nearly the full length of the neck, extreme care being taken not to choke or injure the chick. All worms taken out should be shaken off the hair and scalded or burned.

PREVENTION—The best preventive for gapes is to keep the chicks on fresh, clean soil at all times. If they become affected with the disease, remove them at once to fresh ground where there is plenty of green grass. Ground occupied by chicks affected with gapes should be covered with a thick coating of lime and then spaded up thoroughly or plowed to destroy any worms that may possibly exist. Chicks should not be raised on the same ground again for at least two seasons.

A BEGINNER IN THE HOLSTEIN BUSINESS

John Paul Barker, son of Ohio's state Holstein secretary, seems to know one of the first essentials in dairying.

Roup

Roup is a disease which affects the eyes, nose, and throat. The first signs are watery eyes, swollen eyelids, loss of appetite, and a thin, watery discharge from the nostrils; after a few days the discharge becomes thick and interferes with the bird's breathing. In severe cases the side of the bird's head is hot and badly swollen and the eyelids stuck together with a yellowish, cheesy substance.

Roup frequently develops from a hard cold, but more often is brought into the flock by other birds that have had the disease or have been exposed to it. It is very contagious. The saliva or discharge from the mouth and nostrils carries the germs, and if the sick birds are allowed to remain or eat or drink with the others the disease will spread very quickly throughout the flock. Birds that are out of condition or lacking in vitality are usually the first ones to become affected and the last ones to recover, and sometimes carry and spread the disease for several months after they appear to be cured.

TREATMENT—The sick birds should be removed at once from the flock and put into warm, dry quarters where there is plenty of fresh air but no drafts. Take some warm water, add a little salt (about one teaspoonful to a quart of water), and carefully wash the eyes and mouth, using a soft cloth or a piece of absorbent cotton. It is also well to rub or massage about the nostrils and under the eyes to loosen any of the watery discharge or secretion that may have accumulated there. After cleansing take two heaping teaspoonfuls (one-half ounce) of boric acid, or a small half-teaspoonful (1 dram) of permanganate of potash, which can be purchased at almost any drug store, dissolve in 1 pint of water, and wash the eyes and mouth thoroughly; or dip the bird's head into a bowl of the solution, repeating the treatment two or three times daily. A tablespoonful of peroxide of hydrogen mixed with 2 tablespoonfuls of water and injected into the bird's nostrils with a small oil can or medicine dropper is very beneficial. After the bird has been treated in this manner grease the head with camphorated oil or carbolated vaseline. It is also advisable to put a small quantity of permanganate of potash into the drinking water, as it helps to prevent the disease from spreading. In very severe cases it is best to kill the bird at once, as seldom, if ever, can it be fully and permanently cured.

PREVENTION—Keep the house clean, well ventilated, and disinfected. Be sure that the birds are not exposed to drafts so as to catch cold. Fowls or chicks purchased from other breeders should be put into a separate house. If this is not possible, watch each specimen closely for two or three weeks for any sign of the disease, so that if it appears the bird may be removed before the others are affected.

Chicken Pox

Chicken pox (sometimes called sorehead) is another very contagious disease. It makes its appearance in the form of irregular whitish patches or festers which later develop into brown spots or crusts (resembling a scab of a sore) on the comb, wattles, eyelids, and around the beak and nostrils. In severe cases these patches or sores increase in numbers to such extent that the birds have difficulty in opening their eyes and beaks, and if neglected many will die.

TREATMENT—Apply a liberal quantity of carbolated vaseline to all the affected parts. This treatment after a short time will cause the patches or crusts to soften and drop off, when the tissue or sore underneath should be painted with tincture of iodin or 5 per cent solution of carbolic acid. Five pounds of fine-powdered sulphur mixed with each 100 pounds of dry mash is also beneficial in effecting a cure. As soon as the disease makes its appearance spray the houses and coops thoroughly with some good disinfectant (preferably some wood preservative or coal-tar preparation), and scald the drinking fountains and feed dishes thoroughly with boiling water. Repeat every two or three days until after all the birds have fully recovered.

PREVENTION—Keep all roosting quarters clean, dry, and well disinfected. During the summer, when the disease is most common, mix 3 pounds of powdered sulphur with each 100 pounds of dry mash, allowing the birds to eat all they want. Chicken pox usually attacks late-hatched chicks more often and more severely than early hatched ones, which makes it advisable to hatch as early in the season as possible.

Scaly Leg

Scaly leg is easily recognized by the enlarged, roughened appearance of the feet and legs. It is caused by a little mite which burrows beneath the scales and causes the formation of a yellowish, powdery substance which keeps raising up the scales until they present an unsightly appearance. In severe cases, if the birds are not cared for, the joints of the toes become inflamed and make the birds lame and sometimes unable to walk. The disease is contagious, although it spreads rather slowly.

TREATMENT—Wash the bird's legs well with soap and warm water and remove all loose scales. Rub well with a half-and-half mixture of kerosene and linseed oil (melted lard or vaseline may be used in place of linseed oil), or fill a can with the mixture, and at night, after the birds have gone to roost, dip each bird's legs into it and allow them to soak for a minute; then return the bird to the roost. Repeat the treatment every three or four days until the scales are removed. Oil of caraway used in the same manner is also very effective.

PREVENTION—Spray the roosts, dropping boards, and all nearby cracks and crevices thoroughly and often so as to keep them free from mites. Examine the bird's shanks occasionally, and if any signs of scaly leg appear rub them well with oil, as directed above, to prevent the disease from developing.

Prevention Better Than Cure

Remember that it is much easier to keep birds healthy and well than to cure them after they are sick. Club members are therefore urged to guard against disease by giving their fowls and chicks proper care at all times. Keep in mind the following: Lice, mites, filth, poor feed, dirty water, damp houses, drafts, and lack of care and attention breed disease. Sunlight, fresh air, clean houses and runs, good feed, fresh water, and good care and attention mean health, vigor, and profits.

For information regarding other poultry diseases write to United States Department of Agriculture, Washington, D. C., for Farmers' Bulletin 957, "Poultry Diseases", or ask your poultry club leader to obtain a copy for you.—D. M. GREEN in Farmers' Bulletin 1114.

Trapping Notes

A Water Set for Mink

HOARD'S DAIRYMAN JUNIORS:—Minks travel a great deal in early spring, and it is then that the following set can be used to the best advantage.

First secure a hollow log, about four feet long and five or six inches

A YOUNG MICHIGAN DAIRY FARMER AND HIS FIVE-MONTH-OLD JERSEY HEIFER CALF

This Michigan calf has been fed as much as she will eat and drink from the time of her birth and has never been sick. But the milk has always been diluted with about a fourth as much water, so that the resulting mixture contained twenty per cent water. This dilution of Jersey milk seems to make its digestibility very satisfactory for this calf. The feeder considered this a better practice than that of skimming the fat from the milk. The pail in which the calf was fed was always kept clean, and after the milk was given shelled corn was placed where the calf could get it. This was thought better than to feed corn meal in the milk, as that practice might cause scours.

Do You Belong to the Juniors Club?

If you are a dairy farm boy between ten and eighteen years of age, and if your father or some member of your family is a subscriber to HOARD'S DAIRYMAN, we want you to join the HOARD'S DAIRYMAN Juniors Club.

The Juniors Club consists of several thousand boys like you, banded together to help each other get more pleasure and profit from farm life, and to have the advantage of associating with other boys who live and work and think as you do.

It costs nothing to join the club—and there are no dues. All you need to do to join is just to fill out the coupon and send it to us. We'll at once enroll you as a member and send you a watch fob, a coat lapel button, and the "Dairy Farm Boy's Creed". Do it now—then you'll soon be a full fledged member of the HOARD'S DAIRYMAN Juniors Club.

COUPON

HOARD'S DAIRYMAN Juniors,
Fort Atkinson, Wisconsin.

I want to join your Juniors Club. My father's name is _____.

I am _____ years old and like _____ (name breed) cows best. Send me the watch fob, button, and creed and enroll me as a member.

Name _____

P. O. _____ State _____ R.—

in diameter, or larger if you can find one. Next locate a small spring run that is free from snow during the spring. Place the log in the water, so the spring runs through it, and cover it with dead branches, giving it the appearance of being a hollow log in a brush heap.

The outer end of the log is the place to set the trap, concealing it under mud covered leaves, and hiding the chain and drag under a similar covering. The mink, on seeing the log, is pretty certain to try entering it, as such places are rich in mice; and the mink is fond of mice. The trap should be a No. 1½ or No. 2. And be certain that it is concealed so you yourself cannot detect its presence. A mink cannot be caught in sets that are plainly man-made. It takes longer to construct this set carefully, but that is the only way it will give results.

A Snow Set for Foxes

There are many kinds of sets for catching foxes in winter, but the only one I ever had any great success with is a rather simple one.

There was an old weed covered manure pile back in the fields near which a neighbor had drawn a dead horse. Foxes, great and small, visited the horse, but they always avoided stepping in the traps I concealed about it. Then I noticed how they had formed a little path about the base of the manure pile, evidently a sort of playground for them.

I carefully hollowed out a place in the path and set one No. 215 trap, using waxed paper under it to prevent it from freezing down. The drag I carefully covered with snow, using leather gloves to prevent scent. Then I re-set the other traps about the horse. The second morning I caught a fine fox in the lone trap in the path, and I have since used this type set successfully. Foxes, especially on moonlight nights, are fond of playing about a dead carcass where they are feeding, and in the hurry of their sport they are less apt to note a trap; at the bait they are alert, and that is one reason why it is harder to catch them there.

Winter Weasel Sets

The weasel is seldom prime before January first, except in very cold regions. This fact, coupled with his habit of traveling a great deal, makes it more profitable to catch him in winter. Snow is, of course, an obstacle that spoils many sets. So it does not pay to use sets other than those the snow cannot render useless.

The "cubby" set is perhaps the most successful one under average conditions. It consists of a "cubby" or shelter, made either of boughs or stones, and located where weasels travel frequently such as along a fence or near a stream. Inside the cubby a bait, such as a piece of bloody meat, is suspended so that the weasel must step on the trap beneath it before he can secure the bait. Traps well concealed sometimes catch mink in this type of set. For weasel, the No. 1 steel trap is good, care being taken to fasten it strongly.

Small weasels are often caught in the spring type rat traps, but they are not much good for the large ones. And a weasel, while curious, is no fool; build the cubby so it looks like the natural hiding place for mice, as that is what brings the weasel to investigate, if the bait should be frozen.

Where the snow is not too deep, weasels can be caught in traps concealed on the top of a log that is used by them, such as one crossing a stream. A depression should be cut in the log, deep enough to keep the trap level with the surface, and grooved so that water will run out. If the water isn't taken care of, the first thaw renders the set useless.

A larger trap, such as a 1½ or a 2, is better for the log runway set, because raccoon and mink can be caught at such places. For weasels, of course, the traps must be adjusted to spring from a light pressure.

New York. SMITH C. MCGREGOR.

Junior Letters

Hoard's Dairyman Juniors:—I am going to Lennon High School this year and I can't find much time to write to anybody.

Last year we had a pig club in our school and I joined it. There are seven members in this club. We took our pigs to Owosso Fair and I got first prize. My pig is a boar. Everybody thinks that he is a dandy. I keep track of what he gains. He made a gain of 40 lbs. in 27 days and another time he gained 50 lbs. in 32 days. I thought that was good. Our pigs are Hampshires. Our neighbors are nearly crazy about our pigs. They are going to start to raise them.

Michigan. Myles Martin.

BESSIE BERNICE LINDSAY AND SHEEP SHE IS INTERESTED IN

Hoard's Dairyman Juniors:—We have a fine lot of silo corn. It is white cap dent. The ear corn is smut nose. We got 241 bushels of oats. We have about 32 hens and 50 pullets. We get about 22 eggs a day. We have a litter of five young pups.

We have a new teacher at school. Her name is Mrs. Clara German. I am in the 6th grade at school.

I have my creed framed.

We have about all of our buckwheat cut. One field headed out fine and the other was very poor. The millet is all cut and in the barn. This morning we had to unload a load of millet though it was Sunday. Pa pitches it off the wagon to the mow. I take it from him and the rest of the family mows it away. We have a hayfork in our barn but our barn is longer than most barns and we cannot get from the one end down and around to the floor and the fork has to go to the load, so it takes quite a long rope.

New York. Alfred E. Eisenhardt.

Hoard's Dairyman Juniors:—We have three cows; one is a registered heifer, one is eligible to registry, and the other one a grade cow. They are all Jerseys.

We have a sow with ten pigs about a week old.

Kansas. Warren Thurston.

Hoard's Dairyman Juniors:—I live on a 160-acre farm. I am 12 years old and in the 8th grade.

We have 17 head of Holstein cows and 2 bulls. One cow is mine. She is 3 years old and three-fourths full blood. We have six head of horses.

I have 3 pet pigeons and some Leghorn chickens.

Minnesota. Orice Franke.

PRODUCE BEEF FOR LESS

ALONG THE

Seaboard

the south's newest great railway

Come to the prairie country along the Seaboard, where land is low priced—where beef and pork are made with home-grown concentrates on year-round pastures!

Velvet beans, when planted with corn, yield the feeding equivalent of 16 additional bushels besides an immense amount of hay. Cattle harvest their own balanced ration—get into finished condition for the market.

The silo can be filled any time of the year. Japanese cane yields 20 to 30 tons of good silage per acre. Many native hays yield 20 tons per acre. No sheltered barns are needed.

FARMERS WANTED!

Productive prairie soil and rich hammock land can be had—where there are excellent schools, roads and churches. Write for information.

J. M. Jones, General Development Agent
SEABOARD AIR LINE RAILWAY
Room 122, Royster Building, Norfolk, Va.

FUR COATS AND ROBES

Made to your order from Horse, Cow, Calf, or any hide or skin with hair or fur on it.

FARMS FOR SALE

Where dairy farming is profitable—There are localities in the South where, on account of the rapid development of industrial cities and towns, supplies of dairy products are short and prices are high. In these same localities long grazing seasons and winter cover crops cut down feeding costs and all conditions are exceptionally favorable for profitable dairy farming. Good improved farms can be bought at prices much lower than are asked for similar lands in other parts of the United States. Buy a Southern dairy farm now while prices are still low, make money and build up a valuable property. Forr full infromation write to J. C. WILLIAMS, Manager, Southern Railway Development Service, 1302 Pennsylvania Avenue, Washington, D. C. 14-spl.

For Sale— Choice dairy farms in the dairy center of the world. R. B. HELLEN, Jefferson, Wis. 1*

137 acres fine land. 17 miles macadam roads to City Hall, Philadelphia. Owner's residence, tenant houses, stone stable, modern cow barn, 48 standing and 4 box stalls. Large implement and tool house, chicken houses. Macadam roads each side and through farm. $50,000.00—less than cost of the buildings alone. FARM 2024 N. Tenth St., Philadelphia, Pennsylvania. 8*

160 acres. 2 miles, county seat. Dark clay loam, high state fertility, good 9-room house, 2 good barns, plenty out buildings, excellent 10-acre orchard. $160 per acre. Write us for farm bargains in southern Michigan. MICHIGAN FARMS AGENCY, Box 992, East Lansing, Michigan. 11*

Free Wisconsin Bulletins, soil, climate, crops. IMMIGRATION BUREAU, Wisconsin Dept. of Agriculture, Capitol 125, Madison, Wisconsin. 13-13

Iowa Corn Show

The Iowa State Corn and Small Grain Show will be held from January 3 to 8 in the Iowa State College gymnasium at Ames as a part of the farmers' short course. Under the auspices of the Iowa Corn and Small Grain Growers' Association, an organization of Iowa farmers, the state show has been an annual affair since 1904. Since that time there have been 16 shows.

In past seasons the Iowa State Corn Show has been probably the largest of its kind held anywhere in the world. Each year there have been on the tables from 10,000 to 15,000 ears of corn besides hundreds of entries of small grain, clover and grass seeds, soy beans, alfalfa, and other crops. The successful crop season of 1920 means a large amount of show grain in the state. For this reason the show this year should be large and successful.

This year a cash premium list has been arranged and all premiums will be paid by the association's check at the close of the show. In addition to the cash premiums more than 100 trophies valued at thousands of dollars will be awarded.

Many have doubted the ability of corn judges to select high yielding types of corn. In fact, they have doubted very much the value of corn shows. To determine the relation between prize winning ears and high yielding ears Professor H. D. Hughes of the Iowa Agricultural Experiment Station selected kernels from the different show samples entered in the state show in the spring of 1919. These kernels were planted five to the hill and thinned to three stalks so that the stand would not affect the yield.

In most cases the direct relation of prize winning and high yielding samples was apparent. The results were surprisingly good. An average of thirty-three 80-ear samples gives the following results:

First prize corn, 51.2 bushels; second prize corn, 50.6 bushels; third prize corn, 50 bushels; fourth prize corn, 49.4 bushels; fifth prize corn, 48.8 bushels.

All entries for the show should be mailed as soon as possible to E. N. Bressman, Ames, Iowa, who is superintendent of entries. Entries giving name, address, county in which exhibit was produced, class entered, and varieties of exhibits should be mailed to the superintendent of entries before December 20. Exhibits must be at the show by Thursday, December 30, 1920.

Exhibitors must be members of the Iowa Corn and Small Grain Growers' Association. The membership fee is $1. If you are not a member send your dollar and ask for a catalog and entry blank. All exhibitors will be ranked as professionals or amateurs according to their winnings in previous shows.—E. N. BRESSMAN, Supt.

The United States Department of Agriculture finds hairy vetch the best winter legume for all localities in the eastern half of the United States where red clover fails or where crimson clover is not a success. Vetches make excellent feed, either green or as hay, and are also exceedingly useful as cover and green manure crops.

$5 Gift

Why Land Needs Limestone

Natural lime in the soil becomes practically exhausted in 15 years. Thus, with the very foundation of plant life and soil fertility removed, land cannot produce. — Limestone must be added.

SUPERIOR LIMESTONE restores soil and increases production from 50 to 100 per cent.

Mail Soil Sample for Free Trueg Test

Of Vital Interest to All Dairy Women

(Continued from page 968)

health authorities of the states themselves.

In addition the federal government will make an initial contribution of $10,000 to each state, without requirement of an equal state appropriation. The largest total sum to be appropriated by the federal government under this law would be $4,000,000. With this sum as a nest egg, augmented by an equal or greater amount contributed by the states, existing maternity centers in remote centers now neglected may be expanded and others established. Gradually hospital facilities in city and country can be so extended that no mother anywhere need face dangers through lack of proper care which she now accepts as her lot.

The only enemy which this mighty bill is facing today is indifference. Women alone can save it. People of force and authority count for no more than the single vote of the farmer's wife or the city clerk's wife. What Congress needs to know, and what it must know, is that the voters of the country demand the prompt passage of the Sheppard-Towner bill.

Medical experts testify that babies of mothers receiving intelligent care have a death rate of only 18 to 19 per cent, as contrasted with 40 per cent without it. Can we longer be indifferent in the face of such revelations?

Under the Smith-Lever law the United States is this year spending $47,000,000 on the item of hogs alone. Contrasted with this amount, can we not afford the pathetic sum of $4,000,000 for our own wives and our own babies?

Therefore, dairywomen of America and dairymen who love your wives and your unborn children, write now upon laying down this paper, to your Congressman and Senator urging the immediate passage of this bill. The Senate bill is No. 3259 and the House bill No. 100925. If you do this, and your wives do it, and if your friends and neighobrs throughout the nation do it, there is a good chance of passing the bill before the new Congress convenes in March.

Farm women are fully aware of the risks they run at maternity. Just as we entered the war, Good Housekeeping states that the woman's division of one of the largest farm organizations of North America appealed to an association that was interested in better obstetrics for women. They asked for speakers and organizers in aiding a chain of rural hospitals. At the time there were none to be had. The funds the farm women had were diverted to other sources. These women are today fighting again for their just rights.

Will the dairymen and dairywomen of America write at once to their Washington representatives beseeching, yes, and commanding, the passage of this bill? Is not a human baby worth nearly as much as the baby hog out in the pen? We want to save them both, but our future children and their mothers are only asking for the consideration we have formerly demanded for the beasts in our barns. Shame, America, that you lazily permit 23,000 helpless mothers and 200,000 helpless babies to die just from indifference every year. It is time to act! Write your representatives in Congress *today* that the Sheppard-Towner bill shall become a righteous law.

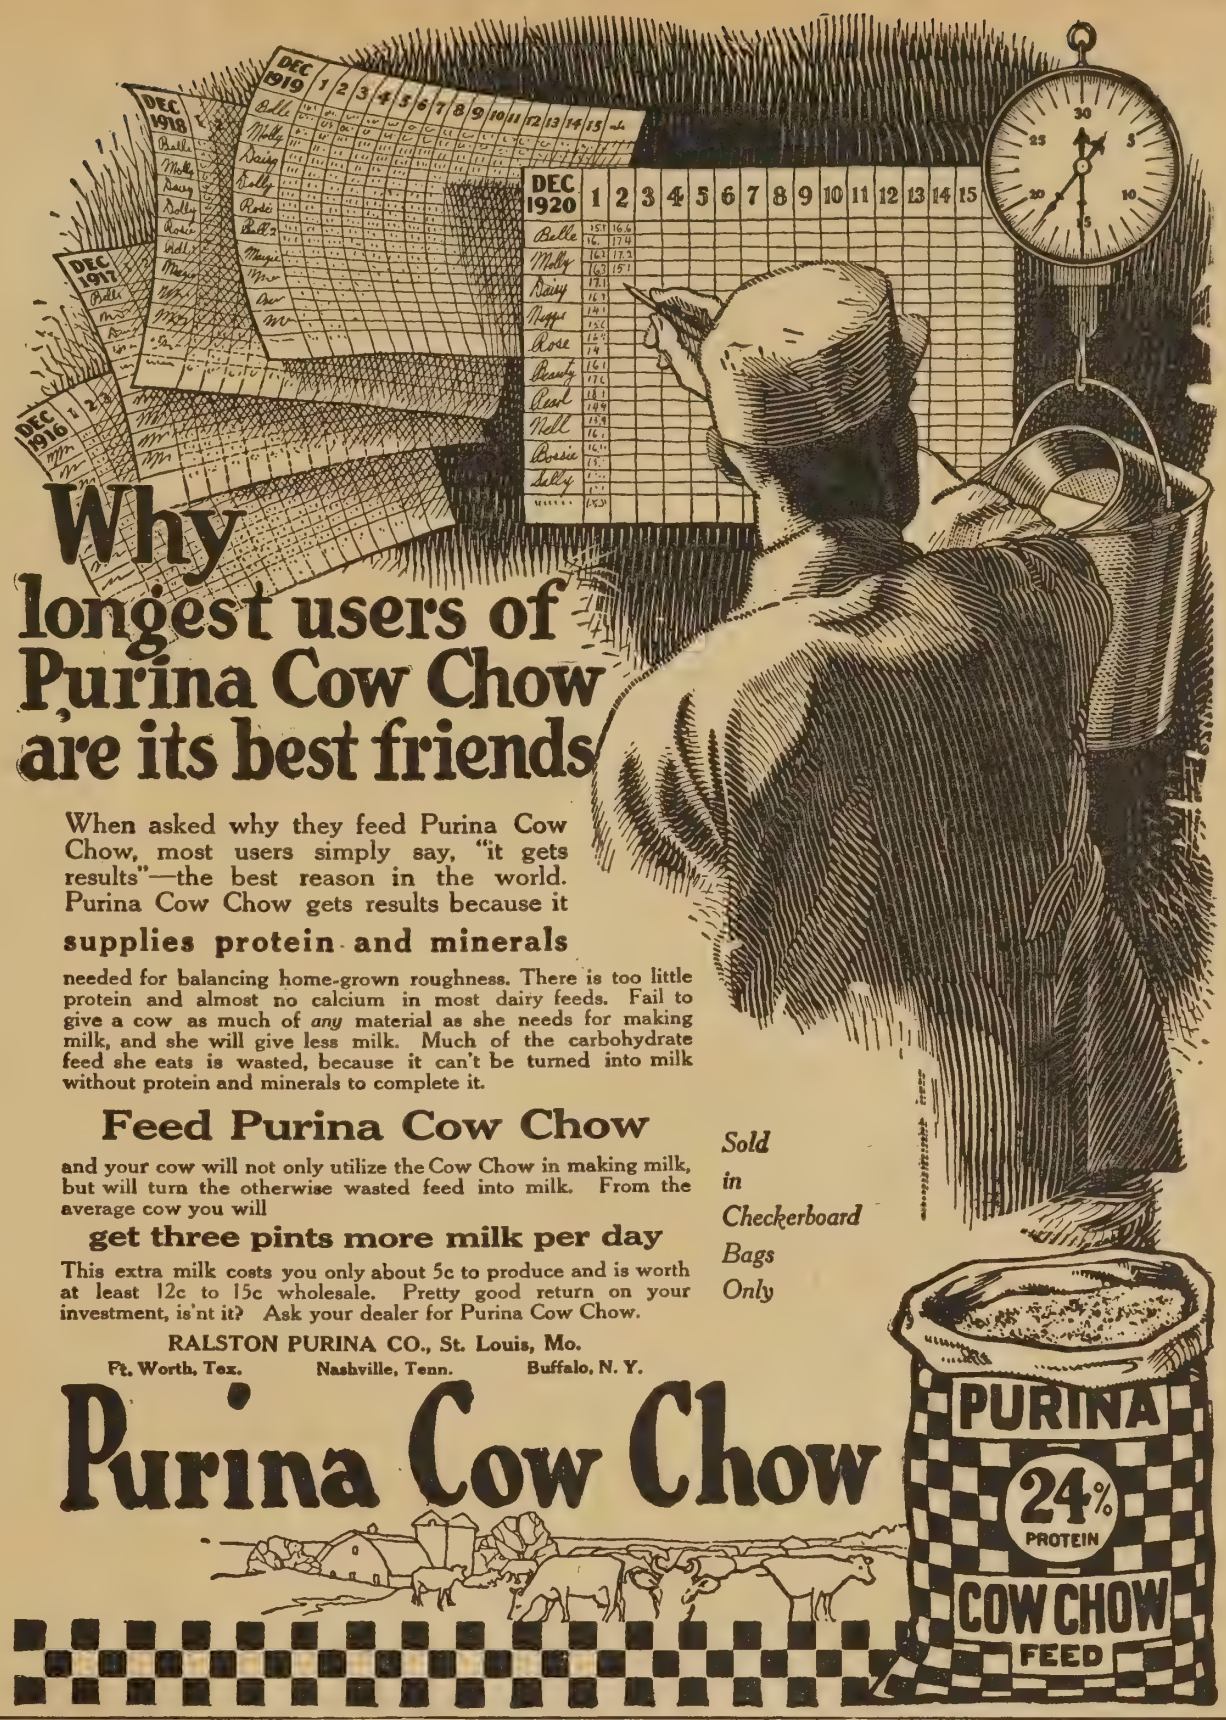
Bull Associations Produce Results



HOARD'S DAIRYMAN:—The limitations under which cow testing associations operate as agencies in increasing milk production throughout the United States as a whole was well illustrated by Mr. Helmer Rabild, of the Dairy Division of the Department of Agriculture, in an address delivered before the American Association of Creamery Butter Manufacturers at its recent meeting in Chicago. Cow testing associations are doing a wonderful work, Mr. Rabild admits, but conditions are such that comparatively few cows, the country over, can be profitably included in association work. There are, he pointed out, some 24,000,000 dairy cows in the country. Of these approximately 19,000,000 are owned in herds of 12 animals or less and the great proportion of these are in groups of three, four, or five cows each. The farmer who has only three, four, or five cows cannot enjoy many of the benefits which one associates ordinarily with dairying. The small size of his herd precludes the periodic testing enjoyed by herds of larger size for the simple reason that the expense per cow would be greater than the returns would justify. The small herd owner is likewise barred from profitable employment of silage as a feeding ration and is in most cases denied the advantage, also, of using a pure-bred sire. For these reasons, it was explained, it must not be expected that cow testing will revolutionize production on the part of some 19,000,000 of the 24,000,000 cows owned on the farms of our 48 states. It cannot be made profitable for the owners of these animals.

Mr. Rabild sees in the bull association, however, an effective agency by means of which any community of small herds can be made to increase its milk production by at least 1,000 lbs. of milk per cow in a five-year period. Where a community is divided into four blocks and a bull is maintained in each block for a two-year period there is no danger of inbreeding, while the cost to each farmer for bull service is reduced to a comparatively low figure per cow. Much better bulls can be purchased for bull association work where sixty to seventy farmers unite for this purpose than is the case where the members of a cow testing association each own their own pure-bred sire. "Nowadays," states Mr. Rabild, "we no longer talk anything less than $1,000 bulls when we go into a community to work up sentiment preliminary to the organization of a bull association. And no matter how "scruby" the cows of that particular region may be, we find that the $1,000 bulls not only win converts to the association but lead more rapidly than would be expected to the introduction of pure-bred herds upon the farms."

In illustration of this fact the speaker told of one community in the South where 60 men who owned 120 scrub cows were encouraged to form an association of this sort with four $1,000 bulls. Those in charge of the work reported that one after another of the members of the new association came to them during the following months and stated that they had reached the conclusion that "their cows were not good enough for those bulls." The outcome of the matter was that by the end of the year the members of this association had purchased 124 pure-bred cows. Results such as this are uncommon, Mr. Rabild asserted. The "coffee cow" of the South, in particular,—an animal which though possessing the female bovine characteristics, produces only enough milk for the daily coffee—gives way before the influence of pure-bred standards represented by the $1,000 bull introduced by the bull association.

The average milk production of cows in the United States is about 4,000 lbs. a year. This is very much lower than in many of the European countries. The average production of cows in Denmark is 5,700 lbs., in England 5,900 lbs., in Switzerland 6,900 lbs., and in Holland close to 7,600 lbs. Denmark doubled its milk production in 24 years and changed a beef breed to a dairy breed during the process. That which has been possible, asserted Mr. Rabild, in the case of a nation is entirely within the reach of any community in the United States by persistence in the use of pure-bred sires. Five years of bull association work will increase by 1,000 lbs. a year the average milk production of the animals included in such an organization.

Illinois. ORIN CROOKER.

Why longest users of Purina Cow Chow are its best friends

When asked why they feed Purina Cow Chow, most users simply say, "it gets results"—the best reason in the world. Purina Cow Chow gets results because it

supplies protein and minerals

needed for balancing home-grown roughness. There is too little protein and almost no calcium in most dairy feeds. Fail to give a cow as much of *any* material as she needs for making milk, and she will give less milk. Much of the carbohydrate feed she eats is wasted, because it can't be turned into milk without protein and minerals to complete it.

Feed Purina Cow Chow

and your cow will not only utilize the Cow Chow in making milk, but will turn the otherwise wasted feed into milk. From the average cow you will

get three pints more milk per day

This extra milk costs you only about 5c to produce and is worth at least 12c to 15c wholesale. Pretty good return on your investment, is'nt it? Ask your dealer for Purina Cow Chow.

Your Private Cow Doctor

If cows could tell their feelings, many a serious illness would be prevented, and constant milk losses would be saved.

Milking cows, particularly, are subject to many ailments that are first manifested only in a reduced milk yield.

Such cow ills you can treat yourself with the aid of Kow-Kare, the great cow medicine. At the first sign of reduced milk flow try Kow-Kare. Use it according to directions and watch the story the milk pail tells.

Dairymen everywhere know the value of Kow-Kare both in preventing disease, and in treating such ailments as Barrenness, Abortion, Retained Afterbirth, Scouring, Lost Appetite, Bunches.

No cow barn should be without Kow-Kare, your private cow doctor. Sold in in 70c and $1.40 packages by feed dealers, general stores and druggists.

Write for free book, "The Home Cow Doctor."

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Help at Calving Time

To make it easy for the cow to calve avoid feeding constipating rations during pregnancy and make the cow take plenty of exercise to keep her muscles in tone. If the rich ration of concentrates is fed right up to calving constipation commonly results, the cow also is too fat and flabby, and when not given adequate exercise her pelvic ligaments and bones will not properly relax to facilitate passage of the calf. Bran and some oil meal will help to regulate the bowels. Some silage should be fed, but only about half the ordinary ration. Roots are suitable feed as an adjunct to bran and oil meal. Clover or alfalfa hay should be preferred to timothy, prairie, or marsh hay. The latter hay is poor stuff for a dairy cow. Prefer it for packing crockery or iron castings.

When it is seen that the cow is about to calve let nature "boss the job". Interference often causes much more harm than good. Make it a rule not to assist the cow unless that is absolutely necessary. If it is seen that calving is abnormally delayed an examination should be made to determine if anything is wrong. If an unnatural presentation is discovered, what is wrong should perfectly be determined and a feasible plan of setting matters right decided upon and then carried into effect. If the three items here suggested are correct in conclusion and consummation the calf will be delivered, otherwise assistance will fail. The calf must be delivered head and front feet, or hind feet and quarters first. It cannot be extracted broadside on, nor will it come away if the operator ties a rope to one fore foot and one hind foot and then applies brute strength. Brains are as necessary as brawn in this work. Brutality, such as hitching a horse to ropes tied to the calves' legs, should be avoided.

Lubrication of the calf and vagina is necessary in all obstinate cases of calving. The natural lubricant present just after breaking of the "water bag" soon dries and the difficulty of delivery then is aggravated. Inject 8 to 10 quarts of raw linseed oil or cotton-seed oil over the calf into the womb when necessary to assist at a difficult calving. If oil is not available use melted lard or slippery elm bark decoction. The latter is well suited for this purpose.

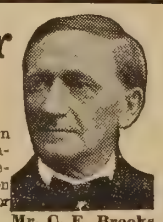
The greatest possible care should be taken to avoid infecting the womb. To that end the hands and arms of the operator and all instruments and ropes should be clean and disinfected. The finger nails also should be pared to prevent laceration. Some operators wear thin, sterilized rubber gloves. After removal of the calf the womb should be cleansed and disinfected by flushing with a bloodwarm antiseptic solution, such as a one-fourth to 1 per cent mixture of Lugol's solution and water, or a solution of a heaped teaspoonful of table salt to the quart of water will do. For a week to ten days after calving the vagina should be flushed out daily with a similar solution. The afterbirth should be buried or burned. Never allow it to be eaten by the cow.

When nature is not given time properly to relax the pelvic ligaments and bones, the hind parts of the calf tend to lodge or jam in the pelvis and forcible delivery then injures the parts. All help should be given as gently as possible. Traction, when necessary, should be downward, as well as outward. It will succeed if the calf's head is gotten into position between its knees and the two fore feet are present in the vagina; or if the hind feet and legs are presented; not otherwise.

Mammary Tumor

I have a registered Holstein cow that when fresh one year ago and the swelling went out of her bag, a good sized lump remained at the base of one hind teat. Just before she was fresh this year it started to swell and scatter over the balance of her bag. She has now been fresh for three weeks and the swelling remains, only it is several times larger than before and is spreading to other teats. It in no way is connected with the milk glands. What can I do for it?

South Range, Wis. A. N. Y.



Tuberculosis of the lymphatic glands of the udder is to be suspected as the cause of the lumps mentioned and to determine this you should at once have the cow tested with tuberculin. Any graduate veterinarian can supply the test. The disease is incurable and makes the milk dangerous for use by persons or animals.

Jersey Cattle Notes

For week ending December 3:

Number of animals registered: Bulls, 140; cows, 505; total, 640. Number of transfers recorded: Bulls, 205; cows, 616; total, 821.

Improving the Milk Market

HOARD'S DAIRYMAN:—My work takes me among farmers a great deal and, since the price of all farm products has declined, one hears discussions on all sides as to causes and probable results. What I have in mind just now is to show that sometimes a man in business is working to his own detriment.

A few days ago I called on a farmer and we discussed the low prices now being paid for milk as also the small price of milk that is now being used for condensing purposes and for manufacture into cheese. This farmer said something that surely is the truth and ought to set every other farmer to thinking. "I cannot understand," he said, "how any of us can expect to get a real price for our products when we, ourselves, use oleo and drink black coffee. A man ought to boost his own business by eating his own product. In doing this, more will be consumed and at the same time, he, who produces the milk, will be advertising his own business. When a person has something to sell, he must do a certain amount of advertising and the place to begin is at home and show other people that we believe in our own goods by using them liberally on our own table."

This thought has never before been brought so forcibly to my attention. If farmers themselves will begin to use dairy products as they should, they will create such a demand for better butter, cheese, ice cream, and the one hundred and one other things that can be made from milk, that there will be very little need to look for a foreign market to take all that we can produce. Because the people of America want the money and want to have the best there is for home consumption, a little propaganda should find an outlet among our own people for all the milk products produced in the United States.

Helps and Handicaps to Dairying

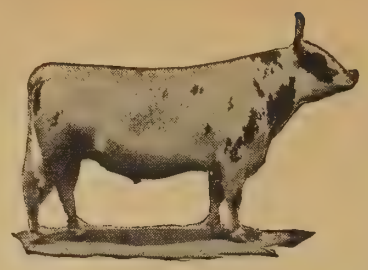
HOARD'S DAIRYMAN:—"What is the biggest handicap to dairying at present?" was one of the questions recently asked the 68 West Virginia dairymen who hold membership in the Ohio County, Greenbrier County, and Eastern Panhandle Cow Testing Associations of that state. Sixteen of them replied shortage of labor and high wages, 21 were just as positive that the high cost of feed was the stumbling block, 21 more mentioned the lack of high producing cows, bad roads was the pet worry of one man, and low prices of milk discouraged 9 dairymen in the eastern part of the state. One man was found who had no kicks in any particular with his condition.

There were three dairymen who noted that butter substitutes and the need of advertising dairy products have been potent causes of low prices of milk in their vicinity. Five others answered that they must receive a higher price for milk through the use of better selling methods and marketing organizations.

The average size of the farms was 158 acres. There were only 16 renters among the 68 dairymen, indicating that dairymen are strongly in favor of owning their own homes. There were 61 silos, all of which were giving entire satisfaction and which were regarded as the mainstays of the dairy business. Twelve members were using milking machines and with but a single exception they were proving entirely satisfactory. There were 266 pure-bred cows kept in the various herds and 48 pure-bred bulls. The pure-bred cows were found in the herds of 35 of the 68 association members.

All the milk in the Wheeling district is handled co-operatively by an organization representing both producers and consumers, and it has proved entirely satisfactory to both parties.

Where different groups are affected by the selling price of an article, there should be a conference of representatives of these groups. The Pittsburgh plan of arriving at the price of milk per quart, which is the plan that takes in Wheeling and vicinity also, is to negotiate each month's price. Organized consumers, organized producers, and organized dealers get together. Representatives of each group state their needs and all learn that by co-operation each group can get justice in price.



The demand for milk is widened because consumers learn the true food value of the milk they buy, but the consumer pleads that as milk is a necessity the price should not be based on what the traffic will bear, but on a program of efficient production on the farm with the least possible cost of distribution. The farmers reply that their interest is in the annual net return and that they are ready to accept somewhat lower prices in summer and autumn if the consumers will co-operate to increase consumption in the spring when production costs are as high as in the autumn, but when the milk production is higher only on account of fresh cows. Consumers point out that drivers of retail wagons are careless in collecting bottles and that there are too many retail wagons on each street. The dealers reply that they can lower the cost of distribution if consumers will take pains to put their bottles out each morning, and see to it that bottles are not used for preserves or carelessly broken in the home. The dealers also agree to reduce the number of wagons on each street.

Costs are lowered in the country by organized dairymen weeding out their poor cows through testing associations and better methods of feeding. A better, cleaner product is furnished on account of more sanitary methods, the cooling of all milk and the eradication of disease from the herds. This is real enlightened co-operation; a co-operation that is enlightened because it is powerful enough to get a full hearing always helps bring justice.

The milk consumers of Pittsburgh and Wheeling have a right to feel that they are securing a good, clean article at a fair price, because the price is based on actual costs of production and distribution. In this connection, Dr. Clyde King, a noted economist from the Wharton School of Finance, of Philadelphia, has been of invaluable assistance in arriving at an equitable price to be charged per quart to the consumer. The Pittsburgh Sales Company, which is the name of the milk producers' organization, has been of great value to the dairy industry in the Pittsburgh and Wheeling district in capitalizing the quality of product, and in leading stability to the dairy business by inspiring confidence among producers that they will continue to receive cost of production, plus a reasonable profit.

The Ohio County Association receives a price of $4.35 per hundred for 3.5 per cent milk. The Eastern Panhandle receives from 54 to 95 cents a pound for butterfat. Greenbrier County receives an average of 75 cents a pound for butterfat. This variance is attributed to difference of location, cost of labor, cost of feed, shipping facilities, etc., so that as a whole there seems to be a reasonable close check on the different districts.

West Virginia. ROSS B. JOHNSON.

We Have For Sale

the well bred Ayrshire bull, Bargenoch "Drexel" (18474) Imported. Bred by John Logan, Bargenoch, Scotland. Born Feb. 2nd, 1919. Color white and red. Sire, Bargenoch Magnificent (9579). Sire of Bargenoch "Royal Champion" sold at Bargenoch sale, 1919, for $7,267.00.

Economy in Production ← GUERNSEYS → Quality of Products

The more you investigate Guernseys, the more thoroughly you will realize that they are the cows you want to buy. Guernseys have the greatest profit producing capacity, and considering the dividends they return, they can be purchased for the least money. A big claim, perhaps, but you will agree if once you own Guernseys, or become acquainted with a breeder who has Guernseys. Let us help you start investigating.

THE AMERICAN GUERNSEY CATTLE CLUB, Box H10, Peterboro, N. H.

Ready For Service

KING CONFIDENCE OF PROSPECT 61174
Dropped October 19, 1919
SIRE: Anton's King Confidence No. 43517. DAM: Anna of Prospect No. 47674, A. R. 5050

This young fellow is one of the big type. He has filled out remarkably since his picture was taken four months ago. He carries the stamp of Anton's King Confidence which we regard as equal to that of any bull of the Guernsey breed. King Confidence is out of one of the best cows we have on the farm.

This bull will put size into your herd as well as the best blood of the breed.

New York Butter Market

NEW YORK CITY, DECEMBER 7:—The nerves of the butter receiver are being severely tried these days as there is a constant downward trend to butter prices. The market is decidedly weak and inactive and prospects of an improved condition are very remote. There are several factors which are responsible for conditions that prevail at present. The most important one is Danish butter, which will undoubtedly continue to arrive in great quantities for an indefinite period as the Danes have made definite plans to develop a permanent market for their butter in this market. Then, too, speculators who stored vast quantities of butter during the early spring months are anxious to dispose of their holdings in order to prevent still greater losses than they will realize if the butter is moved at present prices. In addition, there is a general feeling of uncertainty as to the future of the market and receivers are anxious to move their butter at any price. That condition very naturally causes a downward trend to butter prices.

Practically two million pounds of Danish butter arrived a week ago and it is known that a like quantity is on the water at present. A steamer carrying 10,000 casks has been expected for several days and it is probable that it will be docked today. Some held Canadian butter, approximately five car loads, has been received during the past week. Very little foreign butter from other sources has been received. It is probable that very little Canadian butter will be received in the near future as England has contracted with several Canadian creameries for their surplus output at prices more satisfactory to the factories than could be obtained in this country. Foreign butter, other than Danish, will have little influence on the market during the winter months. However, that from Denmark will be the deciding factor as to whether or not a strong active market for domestic butter will prevail for the next few months.

There is a strong sentiment among butter receivers in general that butter prices should be worked down to a comparatively low level so that the Danes can not afford to ship their butter to this country. Whether or not that would cause them to find other markets for their butter is problematical as their market is limited, as European countries are purchasing little butter at present, and the factor of European exchange makes it profitable for the Danes to ship their butter here even though our prices are considerably below those which obtain in European countries. The Danes have as an objective the establishment of a permanent market in this country and would willingly lose some money at present in order that the consumers of this country may be educated to demand the high quality Danish butter. It is already quite evident that the butter is in greater demand than it was a few months ago and it is quite probable that the Danes will have little difficulty in realizing their ambition. There is a possibility that the incoming federal administration may increase the duty on butter thereby shutting out considerable of the present supply of foreign butter. Even then, if foreign exchange does not improve, the extra duty will not necessarily cause a curtailment of shipments to this country.

On Friday, November 26, extras were quoted at 60c, there having been a price decline of 5c on that day. On the following day, there was a further price decline of 3c. The quotation then remained until the following Friday when there was another radical decline of 3c. An additional price of 2½c materialized the following day but yesterday there was a recovery of ½c. There was no change today but the market was without life and there is a probability that there will be additional declines. Demand continues only for butter of fancy quality. Danish butter is moving quite readily at prices from two to three cents under the quotations on domestic butter. There is little demand for other foreign butter. Established quotations today are: Extras (92 score), 51½@52c; higher scoring than extras (93 score), 52½@53c; firsts (90—91 score), 46½@50½c; firsts (88—89 score), 43@46c; and, seconds (83—87 score), 36@41c.

W. B. LIVERANCE.

Oregon County Farmers' Week

The annual Farmers' Week at the Oregon Agricultural College held in past years late in December has been postponed until June of next year and an innovation in agricultural extension is being instituted in a series of county farmers' weeks for the coming winter. The idea of a series of such events developed out of a very successful county farmers' week held n Multnomah County last year. One day was devoted to a single line of agriculture and at the end of a week a total attendance of 1,600 had been recorded.

This year it is planned to hold approximately twelve such events in as many counties at the close of farm bureau membership campaigns. One day will be devoted to each of the main lines of work adopted in the farm bureau program with the final day known as farm bureau organization day which will mark the completion of the county organization drive.

Oregon. F. L. BALLARD.

We Offer Choice Sons of

SIR ECHO SYLVIA JOHANNA
A ⅞ brother to the $106,000 bull. His six nearest dams average over 35 lbs. butter and 700 lbs. milk.

Young Holstein Bulls Backed by Yearly and Seven-Day Records

Herd under Federal Supervision

We have several young bulls up to 17 months of age, sired by Maplecrest Sir De Kol, whose dam made 31.07 lbs. of butter and is a daughter of Daisy Grace De Kol, former World record Junior 4-year-old in the yearly production division.

These bulls are all well grown, and are of show type individuality. They are from dams with records up to 31.70 lbs. of butter in seven days, and 640 lbs. of milk.

Included in the above are a few young calves from 2 to 4 months of age from untested dams, which I will price very reasonable for immediate acceptance.

Prices and full description, with photographs will be furnished upon application.

These calves should be seen to be appreciated.

These 55 breeders whose herds are located in all parts of the Empire State have permitted an experienced judge to walk into their herds and choose any animal coming up to his exacting requirements.

They have done this for two reasons. They know it is only animals of this class that discriminating buyers seek, and that it is only animals of this class that will make this first state sale a success.

Ordinarily, one would expect to find in such a collection of over 200 animals some that would not quite measure up to expectations. We do not intend that a single animal will be offered in this sale for which there will be any sort of an apology. Already overworked with indiscriminate use, the word "Best" cannot express what is to be found in this first state sale. It, however, means just what breeders would like it to mean—perfect individuals, healthy animals of good breeding, sold by reputable consignors.

You will buy in this sale individuality such as has never before been approached. You will buy animals that are as free from any contagious disease as is possible to determine, not only from observation of the condition of the herd at the time of selection, but also by means of the three tuberculin tests, that is, intradermal, subcutaneous, and ophthalmic, and ALL ANIMALS OVER SIX MONTHS OF AGE ARE SOLD WITH A 60-DAY RETEST GUARANTEE.

It is not necessary to enlarge upon the good breeding in such a collection. Offhand, we call to mind at least a half dozen 30-lb. cows, at least two above 35 lbs., at least as many sons and daughters of cows with 30-lb. records and of course the usual run of 20- and 25-lb. cows and two-year-olds.

The admission of an animal to this sale under its stringent regulations is in itself their best recommendation.

The catalog, yours for the asking, will be ready for the mails January 1st. Send for it now.

THE MOYER SALE

Syracuse, New York Jan. 4-5-6 3 Days, 2 Evenings

270 Head

Give Careful Consideration to This —

This is the ninth of a series of sales which I have conducted. In the first eight I sold 1,400 head for a total of over $1,500,000. To my knowledge less than a dozen of those 1,400 animals reacted under the retest.

For this sale I have selected animals from breeders whom I believe to be reliable. Every one of them gentlemen from whom you would be pleased to buy animals, knowing you would find them exactly as represented.

And REMEMBER—All animals over six months of age not in herds that were accredited, were tuberculin tested previous to their acceptance for this sale—will be tested again just previous to the sale and ALL ARE GUARANTEED UNDER A SIXTY-DAY RETEST.

Re-test Guarantee

Thirty-Three Sons and Daughters of 30-lb. Dams —

Twenty Daughters and Granddaughters of 1000-lb. Long-Distance Cows —

13 daughters of Sir Veeman Vale Pontiac
12 daughters of King Segis Pontiac Alcartra
6 daughters of King Lyons
5 daughters of King Joh
5 daughters of Spring Farm King
5 daughters of Sir Aaggie Mead De Kol
5 daughters of King Lunde Pontiac Korndyke
6 daughters of Sir Echo Sylvia Pontiac Paul
5 daughters of King Artis Lyons
9 daughters of Winana De Kol King Segis
5 daughters of Annie De Kol Model Segis
5 daughters of Rag Apple Butter Clyde King
6 daughters of Model Darius Glista
2 daughters of Prince Hengerveld Pietje
2 daughters of Sir Pietertje Ormsby Mercedes 37th
3 daughters of King Echo Sylvia Model
30 bred to Empire Segis
25 bred to Sir Aaggie Mead De Kol

I am pleased to say that practically every consignment is rich in the blood of King Segis. A hundred forty-six animals in the sale trace directly to him.

The new world champion milk producer, the first cow to defeat Tilly Alcartra, is the granddaughter of King Segis and her dam traces directly to Prilly. The new world champion 2-year-old is a granddaughter of King Segis. The world champion 4-year-old is a granddaughter of King Segis. The grand champion male and female at the Pacific International Show were by a grandson of King Segis.

Limited space prohibits mentioning all the great animals, but some of the leaders are: Two 30-lb. daughters of King Lyons, both from 30-lb. dams; ten daughters of the $50,000 bull, all from 30-lb. dams; a show daughter of King of the Ormsbys—second dam a 35-lb. cow; a heifer due in January with thirty 30-lb. dams in her pedigree; a 30-lb. sister to the dam of King Lyons; six daughters of former world champion cows; two granddaughters of May Echo Sylvia; a son and three granddaughters of Champion Echo Sylvia Pontiac; scores of cows with records of 20 to 30 lbs.; three daughters of 1000-lb. cows; four daughters of cows above 35 lbs.

It is not necessary to go into further detail about such a collection of animals. Any student of Holstein pedigrees knows how rarely it is possible to find such a wealth of breeding. We are selling the days of January 4, 5, 6, and the evenings of January 5 and 6, during which time there will be sold 270 head of as good Holsteins as any one has ever had an opportunity to purchase. Close to one-half of the entire offering is due to freshen in January, February and March, all of them in calf to great sires.

Be Sure to Make Your Plans to Attend

H. A. Moyer, Director, Syracuse, New York

3 BIG SALE DAYS

IF YOU ARE A REAL HOLSTEIN MAN
Send for the Catalog

I have made a special effort to get this out on time and it was ready for the mails Dec. 15th. Only this book can tell the story of this great collection. It will only be sent to those making inquiries, but will be gladly sent to those anxious enough to write for it.

The Catalog is Ready

HOLSTEIN CATTLE

Fred H. Lee, Plymouth, Michigan, writes:

"I have 26 head of Purebred Holsteins, all descendants of my two original cows. I have become owner of a large farm near Detroit, which otherwise would have been impossible. I have not been able to back Holsteins but Holsteins have had to back me."

Holstein Breeders are the Finest Fellows in the World, But They Should Boost

We Need *Boosters* in this Business—Not Half-Hearted Ones, *But*

REAL BOOSTERS

Do you realize that this great business of ours is only in its infancy? That prices are going to increase, and should exceed those of the past? That the fellow who fills his barn with Holsteins now is the fellow who is going to have the money to build a new barn a year from now?

Did it ever occur to you to be grateful to your Holstein herd for the fact that you have a barn full of a paying investment, instead of shelves laden with merchandise constantly decreasing in value—the situation in most other lines of business?

Do you know any other commodity that would pay you as well as the Holstein cow that fills the pail to overflowing at every milking, and gives you a beautiful calf every year?

You realize these things. Then talk about them, and

BOOST

Just to show you that we are sincere about this thing, we are not going to mention the bulls and heifers we have for sale (and we have a lot of splendid ones), but are going to use this advertising space to spread the gospel of better live stock and to

BOOST HOLSTEINS

J. M. HACKNEY

Your Choice of **50** Young Bulls

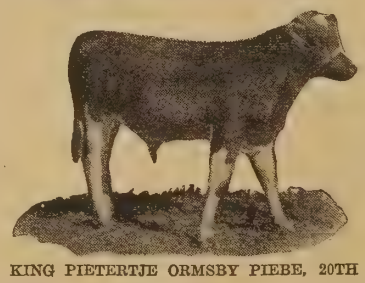
They Are Out of Yearly Record Dams And Sired By—

—King of the Ormsbys His dam, his dam's dam, and his full sister all have semi-official records above 1,000 lbs. His own dam has four records above 30 lbs. in 7 days and three above 1,000 lbs. in 365 days.

—King of the Sadie Vales His dam is a 38-lb. cow and both of his granddams are 41-lb. cows. His three, four, six, nine, and twelve nearest dams average over 31 lbs. in 7 days.

—Johanna King Segis His sire is a yearly record son of King Segis, and his dam is a 40-lb. cow—the first cow to produce over 500 lbs. butter in 120 days.

—Sir Inka Prilly Segis He is a 30-lb. son of King Segis. He has 20 daughters with semi-official records, and 15 are now on test.



If a saving of from $100 to $500 on a bull means anything to you, then write for our new price list which shows pedigrees of the bulls we have for sale.

FOR SALE — A Few Splendid Cows Bred to —

These Famous Sires

SIR PIETERTJE ORMSBY MERCEDES 37TH

He already has two 1,000-lb. three-year-olds and a 900-lb. junior two.
A full sister has twice made over 1,000 lbs. in 305 days.
Dam:—Spring Brook Bess Burke 2d. 1,290.91. Two other records above 1,000 lbs.

SIR PIETERTJE ORMSBY MERCEDES 41ST

His daughters are real producers and show ring winners. One of his daughters was grand champion at the Dairy Cattle Congress, defeating the National Champion.
Dam:—Spring Brook Bess Burke 1,094.16, "Greatest Mother of the Breed".

And You Know Their Sire —

SIR PIETERTJE ORMSBY MERCEDES, the world's greatest sire of show ring winners and yearly producers. Thirteen of his daughters have made above 1,000 lbs. Twenty have made over 20,000 lbs. milk in a year.

We are offering a few splendid cows—not culls—bred to these bulls at prices that will move them quickly. Come and look them over.

E. C. SCHROEDER FARMS *(Fully Accredited Herd)* **Moorhead, Minnesota**

Minnesota Holsteins

Miss Korndyke Akkrummer Ormsby 30-lb. 4-year-old. 39.67 lbs. butter at full age. Owned and developed by J. B. Irwin.

For Your Next Herd Sire

get a son of Sir Ormsby Banostine Champion, son of Duchess Skylark Ormsby, world record cow. We have some good ones for sale from dams with good 7-day and year records.

Woodlake & Clover Farms,
John B. Irwin, Station F,
Minneapolis, Minnesota.
"The Home of the Ormsbys."

Bull Calves of Ormsby Breeding

from A. R. O. dams for sale, 2 to 8 months old. Prices $200 to $1,000. We can also offer several good, typy cows bred to a good Ormsby bull. Write or come and see us.

MINERAL SPRINGS STOCK FARM, - - SAVAGE, MINNESOTA
Stuart—McIntyre—Hansen, Owners.
Address correspondence to Axel Hansen, formerly with John B. Irwin.

Just About Ready for Service — $500

is this bull we offer, and individually as good as his sire, Sir Walker Segis Homestead, first prize yearling bull at Chicago and Waterloo, 1919.

His dam just finished 305-day test with over 12,000 lbs. milk and 500 lbs. butter (2 milkings daily) as junior two-year-old and is a show heifer, first prize two-year-old and champion female at Minnesota's largest county fair and Holstein show (175 head).

Send for pedigree and photo.

Federal Accredited Herd) **A. J. Lashbrook, Northfield, Minn.**

Lola Segis Pontiac Homestead

the highest record bull in southern Minnesota, heads our herd. His sire, Piebe Laura Ollie Homestead King, has more daughters that as 2-yr.-olds have produced 20,000 lbs. milk in a year than any other. His dam, a 34-lb. 4-year-old daughter of King Segis Pontiac Count, has 3 records averaging 33 lbs. and has made over 1,000 lbs. in 1 year. We have a few serviceable bulls and younger from A. R. O. dams for sale.

Clover Lea Farm, W. W. Walker, Owner. Austin, Minnesota

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

COME TO BISCAY

for your next purchase of pure-bred or grade Holstein cattle, mature or young stock. Large selection, also a few select male calves to offer. Located near station.
BISCAY SALES CO., BISCAY, MINN.

Sir Korndyke Ormsby De Kol 15th—21 Months Old

His sire is a son of Sir Korndyke Hengerveld De Kol; 51 A. R. O. daughters, one of whom has a 7-day record of 39.56 lbs. and several above 1000 lbs.

His dam has a record of 23.778 lbs. and now on yearly test.

Geo. H. Elwell, - Minneapolis, Minn

Grandsons of Sir Pietertje Ormsby Mercedes

The sire is Sir Pietertje Ormsby Mercedes 22d a son of Minnesota's first 1000-lb. cow. These bulls are all nicely marked, straight top lines. Very good individuals from good A. R. O. dams.

For pedigrees and prices, write

O. J. GROVER, - GLYNDON, MINN.

Grandsons of S. P. O. M. 41st and a Few Good Cows For Sale

The cows either have A. R. O. records or are from tested dams, and are in calf to my herd sire, a son of S. P. O. M. 41st. The young bulls are from A. R. O. dams.

Herd under state and federal supervision. Write for complete information to

V. R. HOLMES, - ANOKA, MINN

Grandsons of

Duchess Skylark Ormsby and of S. P. O. M. 38th.

for sale. These youngsters are from A. R. O. dams that are now making good yearly records. Write today for further information.

POPLAR HOLLOW STOCK FARM,
Bertram D. Scott, Prop., Hotel Hastings
Minneapolis, Minn.

Lake Shore Holsteins

40 pure-bred heifer calves, 6 months to one year, $150 to $200 this month. Good type, good backing.

E. J. Oppliger, Forest Lake, Minn.

Mankato Holstein Farms

Our Herd Bulls

King Colantha Ormsby Bess, A Sir Pietertje-Bess Burke combination. Nine dams average over 1,000 lbs.

A son of Ormsby Korndyke Lad. Ten daughters over 1,000 lbs. butter, eleven over 22,000 lbs. of milk.

A son of Sir Pietertje Ormsby Mercedes 14th, that great transmitting show sire.

Both Males and Females For Sale

Marlow & Randall, Mankato, Minn.
(A Federal Accredited Herd)

BULLS—Two of Them.

Ready for service. One light and one medium in color. One sired by our DUTCHLAND CREAMELLE COLANTHA LAD, from a good daughter of SIR WINANA BEETS SEGIS. The other sired by SIR WINANA BEETS SEGIS from a daughter of SEGIS JOHANNA GRAHAMHOLM. Both cows are on yearly test now and are making good records. Don't buy a bull until you have seen and studied the pedigrees, pictures and prices on these youngsters. They are good ones. **GRAHAMHOLM FARMS,**
H. R. Searles, Mgr. Rochester, Minn.

For Sale

A Few Good Females

Several High Class Young Bulls

I have a few good ones left. Write me at once if you are in the market for a herd sire or a few foundation females.

CHAS. OBY, Maple Lake, Minn.

RICHLY BRED

HOLSTEIN BULL CALVES

out of A. R. dams and sired by our two richly bred herd sires — **King Piebe Ormsby Mercedes,** a 35-lb. son of Sir Korndyke Bess and every dam in pedigree over 22 lbs. and **King Pietertje Mercedes Ormsby,** a son of Sir Pietertje Ormsby Mercedes and out of a 19-lb. senior two-year-old dam.

Herd tuberculin tested. Write for information or visit herd.

P. FROST SPAULDING FARM CO.
C. L. Spaulding, Mgr., Warren, Minn.

6 Good Cows For Sale

THE MINNESOTA KIND

They are all by a 36-lb. sire, are bred to a son of King Korndyke Colantha Ormsby, and are due to freshen this fall and winter. They are from 3 to 5 years old and absolutely straight and right. Lack of barn room forces us to sell. Write or come and see them.

E. J. Brosious, - Stillwater, Minn.

Female Holsteins for Sale

Pure-bred cows and heifers of choice breeding. Bred to our herd bull, "Sir Ormsby Segis Korndyke". Also fifty high grade cows and heifers, fresh and springers.

ISLAND PARK STOCK FARM,
Hanscom and Anderson, Props.,
R. F. D. 1. St. Cloud, Minnesota.

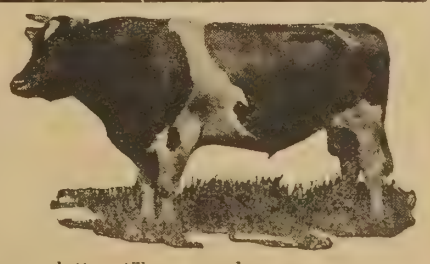
Grandsons of "Piebe"

We have for sale a few 5-8 months old sons of Lola Segis Pontiac Homestead, he a 34-lb., 1,000-lb. son of Piebe Laura Ollie Homestead King. Most of them are from good producing daughters of Joe Oak De Kol Fobes, a grandson of Homestead Junior De Kol. Price $125 to $250.

Write us at once if you want one.

RANDALL BROS. Lakeland, Minn.

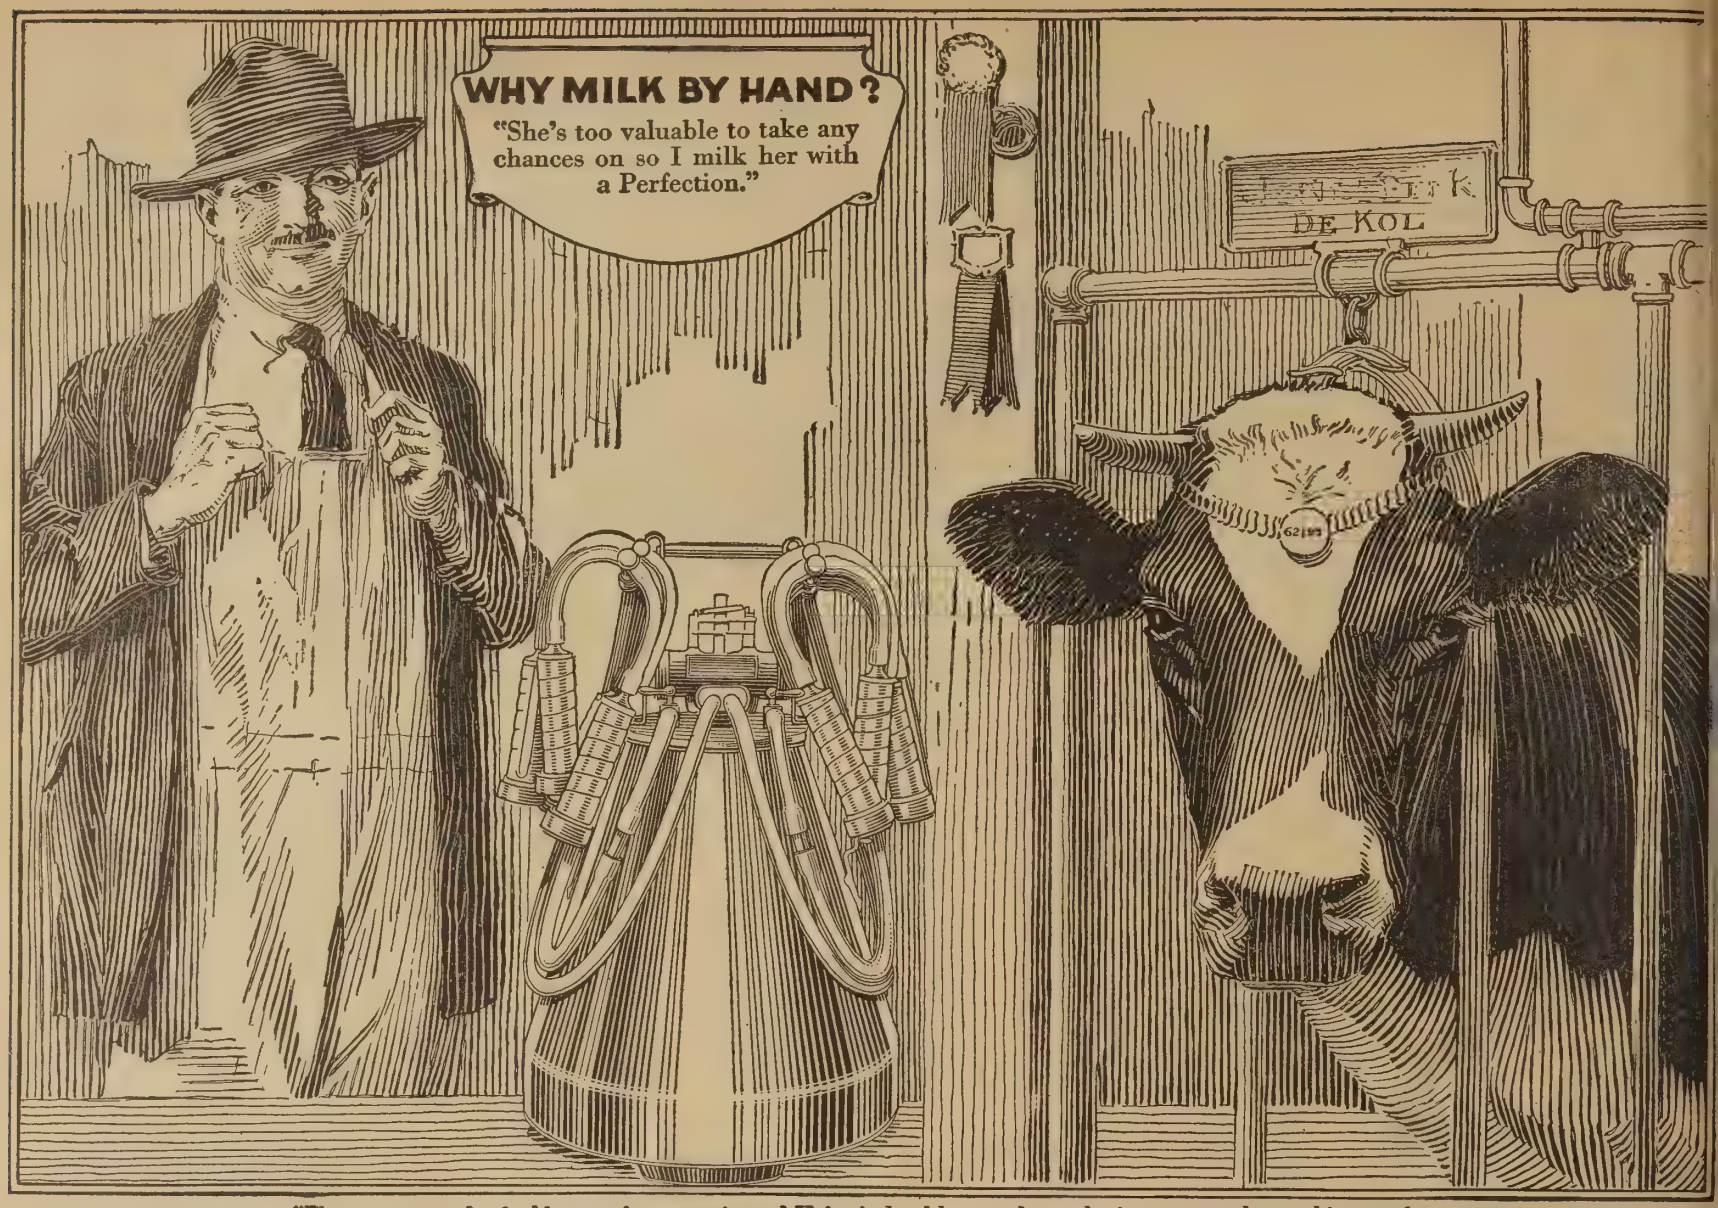
We Believe



King Segis Pontiac Fayne Star is the best individual King Segis Pontiac Count ever sired. We believe that he is destined to rank as the best son of his famous sire. There will never be a better time to buy one of his sons. A postal brings the bull circular. Write right now.

Flecks Farms, Faribault, Minn.

Serviceable Sons of "Piebe"



are for sale. We have several from well bred, good, year record cows, cows with records up to 1,100 lbs.

Piebe Laura Ollie Homestead King is the phenomenal present day sire with 7 daughters that average over 20,000 lbs. milk as 2-year-olds. He is a show bull as well and his sons and daughters have been winning at the shows this fall.

Better write us at once or, better still, come and see us.

MINNESOTA HOLSTEIN CO., V. S. Culver, Sec'y & Mgr., Austin, Minn.

"There are several valuable cows in our registered Holstein herd but we do not hesitate to put the machine on the best of them since there is no possible danger of hurting them and the cows take to it readily." —JOHN SELF.

A Safe Way To Milk Your Valuable Cows

ARE you willing to take chances on the milking of your valuable cows? Perhaps you milk them yourself to make sure they are milked safely and their production kept up. But why take chances or milk them yourself when there is another way that's safe and in addition will save you time and work? That way is the Perfection Way.

Thousands of dairymen have found the Perfection Milker a safe way to milk their valuable cows. The reason is clear enough—*Perfection milking is nature's way.*

Like the calf, Perfection milks with a gentle suction followed by a downward squeeze, followed by a period of rest. Is it any wonder that many prominent breeders through the country use the Perfection on their valuable herds? They will tell you that their cows prefer the Perfection and give more milk than when milked by hand. Best of all they have found it the safest way to milk.

Investigate This Safe Way of Milking

Write and let us send you a free copy of "What the Dairyman Wants to Know." It tells of the safe way to milk. We'll also send you names and addresses of Perfection owners near you.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Success Depends Upon the Man

There are two kinds of men in the world; those who sail and those who drift; those who choose the ports to which they will go, and skillfully and boldly shape their course across the seas with the wind or against it, and those who let winds and tides carry them where they will. The men who sail in due time arrive; those who drift often cover greater distance and face far greater perils, but they never make port. The men who sail know where they want to go and what they want to do; they do not wait on luck or fortune or favorable curents; they depend on themselves and expect no help from circumstances. Success of the real kind is always in the man who wins it, not in conditions. No man becomes great by accident. A man gets what he pays for, in character, in work, and in energy.

There are few really fine things which he cannot get if he is willing to pay the price. Men fail, as a rule, because they are not willing to pay the price of the things they want. They are not willing to work hard enough to prepare thoroughly enough to put themselves heartily into what they are doing.

The only road to advancement is to do your work so well that you are always ahead of the demands of your position. Keep ahead of your work and your work will push your fortunes for you.

Our employers do not decide whether we shall stay where we are or go on and up. We decide that matter ourselves.—HAMILTON D. MABLE.

Alsike clover is most at home in northern latitudes or at high altitudes. It thrives best in a cool, moist climate.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

The Joy of Giving

Ah! the joy of giving,
Better than the gift.
Like a flash of sunshine
Comin' through a rift.
Making others happy,
Making others glad.
Spiritual, I'd call it,
Not a Christmas fad.

In your heart a yearning
For to see the smile
In somebody's spirit,
Last a little while.
Not the value, mind you,
Not the money-worth.
But the Christmas spirit
Of sweet Peace on Earth!

Little children happy,
Elders, eyes a-brim.
Someone murmurs, softly—
"That was nice of him."
Ah! the joy of giving,
That must play a part,
When the gift comes, brimming
From an earnest heart.

Dairy Jim's Philosophy

I would rather have ten cents worth of gift at Christmas from somebody who gave because their heart was in the job, than one hundred dollars' worth from the feller that gave because he thought it was his duty.

A lot of things are hung on a Christmas tree but the best of 'em all is what you can't see, even by candle light—and that's love!

The herd is my best Christmas gift—and it's one that lasts the whole year 'round. Santa Claus lives out yonder in that big dairy farm. So you see, I still believe in Yuletide!

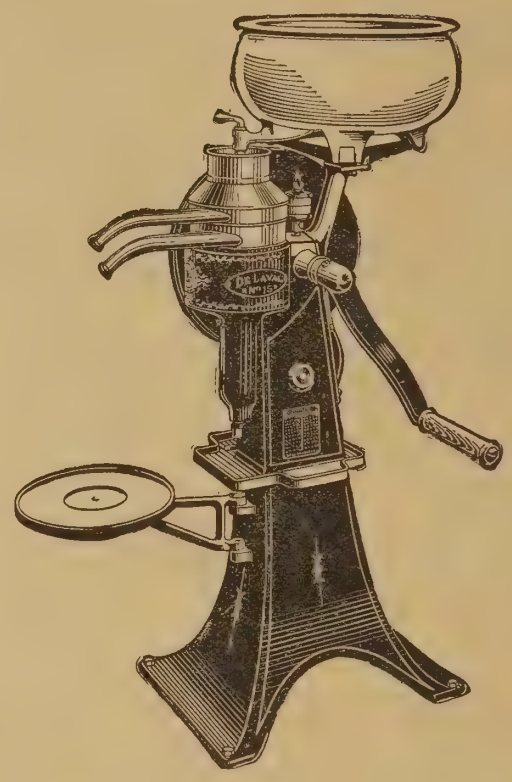
Jones—"What are you giving your hired man this Christmas?"

Smith—"An alarm clock, a new suit of overalls, and a conscience. And if there's anything left over, I'll give him a nice book on how to run a tractor."

The Boy at Christmas

Another Christmastide has come,
Another day of Yuletide joy.
But, sweetest of the gifts—all gifts,
Is having you—my precious boy.
So many boys have left the farm,
So many sons have gone away,
The greater gift of all I know
Is you—your loving arms today.

The tree—the lights—the ecstacy
That comes when Santa is around.
The snow white fields, the well stocked barn,
The dormant wonders of the ground.
All these seem small compared with this—
This greater joy of having you.
My boy is here—on Christmas Day,
And love bides with us, surely, too.



Feeling Happy

What makes people happy? What makes people glad?
What brings lots of sunshine when th' going's bad?
Maybe it's your spirit—what you say and do.
How you scatter blessings all a lifetime through.
This here feeling happy is in sunshine spread,
And the heaps of blessings on some other head.

What makes people happy? Well, I think I know:
It's their way of livin'—and th' deeds they show.
Selfish folks are lonely, selfish folks are sad,
But, do things for others—when they've never had,
And you'll find Peace coming, over hill and dale,
Bringing you the pleasure, when the selfish fail.

What makes people happy—it's a Christian thought.
It's the world-old battle, every man has fought.
Give and love and suffer, as we all must do,
And there comes a blessing on the head of you.
Life is sort o' funny, in that sort o' thing,
When we make folks happy, then our hearts will sing

Wherever there are cows there should be a DE LAVAL SEPARATOR

A DE LAVAL Cream Separator is an essential piece of equipment on every farm where there are two or more cows. Even though you sell whole milk you should have a De Laval to protect you against changing market conditions. It will turn the surplus you sometimes have into a readily marketable product.

Thousands of De Lavals have been installed to meet such emergencies and each one has paid for itself many times over. In all, there are more than 2,500,000 De Laval Separators in use throughout the world — each one giving its owner service and profits that he could get from no other machine.

The De Laval skims cleaner, turns easier and lasts longer. Therefore it is the most economical and most satisfactory separator to buy.

Ask the De Laval agent nearest you for a demonstration, or write nearest De Laval office.

The De Laval Separator Co.

New York	Chicago	San Francisco

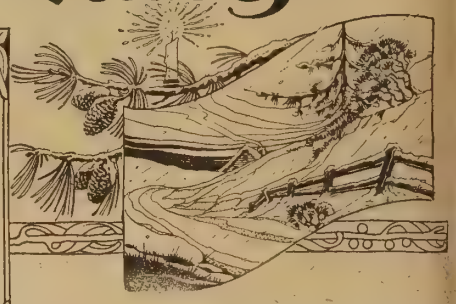
Xmas *and the* Herd

IT'S when the snow is flying and there's Christmas on the air,
And "Peace on Earth" is ringing from the towers everywhere
That my thoughts turn, more than ever to the cattle—to the herd,
To the service they have rendered and the promise of the word.
Yes, the service! Loyal, willing—and the records, day by day,
And the gift they give, unending, in their own, unselfish way.

At Yuletide, we pass presents, in the spirit of the time
And we praise the love o' giving in our speech and in our rhyme,
But the herd keeps on a-giving, from the summer to the snows,
From the month of frigid weather to the month of bird and rose.
There's no season to their giving—it's a present every day,
And it's Christmas when its Christmas and it's Christmas when it's May.

That's why, when candles glitter on the green boughs of th' tree,
And there's lots of happy laughter—that the feeling comes to me—
I want to sing their praises—give them a Christmas thought,
Thank them for all th' blessings their years of toil have brought.
It's gratitude, old fashioned, and homely, but sincere,
The herd has made it Christmas for all us fellers here.

Pass out the presents, mother, light up the Christmas tree,
I smell the turkey cooking, with an extra slice for me.
But I've been out to see them—snug in their beds o' hay,
I've talked to them, and patted each fine, fair head today.
They know I'm more than grateful for what they've given, too,
And said their "Merry Christmas" with a quaint Kris Kringle "Moo".



W. LIVINGSTON LARNED

Christmas On The Dairy-Farm

Helen S. K. Willcox

H. S. K. WILLCOX

THE first fluffy snow blanket, arriving early in November, is always the signal at our farm for sundry joyous exclamations like these from the little folks, "Oh, mother! Christmas is 'most here!" and "We must write our letter to Santa Claus now!" and "How many weeks will we have to be real good, mother?" For reasons sufficient to the average American parent, the latter question is eagerly seized upon and answered without delay, and for a space of twelve very long, memorable weeks three much alive kiddies try their hardest to be as good as gum in order to propitiate old Saint Nick and insure a visit from the clever fellow—whose memory is fortunately short, perhaps, where the innocent and sometimes premeditated shortcomings of his young admirers are concerned.

So throughout November it is busy times in the dairy farm house, or in any home for that matter, where there are children and relatives galore to be remembered with little gifts and entertained, but Christmas preparations reach their climax with the advent of jolly old December—and mercy! how busy and excited everyone becomes when a child calls down on a wintry morning, "Only three weeks before Christmas!" So in addition to the daily house chores—meal getting, dish washing, sweeping, dusting, 'redding up', milk pails washed and scalded, sewing, mending, baking—and a dozen others—we manage somehow to crack several hundred butternuts in preparation for the big Christmas cake, to pop corn by the panful for stringing long garlands to decorate indoors, to color and cut out blue and golden stars from crepe paper for further decorations, to hunt up and learn jolly Christmas 'pieces' to be recited after the big Christmas dinner, and, as Christmas draws nearer and nearer, to go out in search of a just-right hemlock tree and great piles of hemlock and pine branches—the latter for wreathes to be hung under the outside of each window.

And, of course, these wonderful preparations mean everything to the children, in fact, Christmas at our house lasts for two months, instead of but one day, for it was a wise person who rather sadly admitted that anticipation is usually better than realization and, while the youngsters undoubtedly think nothing on earth is more blissful than the opening of the stockings on the great morning, yet I am convinced that their after memories will go back to the happy days before Christmas when, in front of the large fireplace, they speculated mysteriously on Santa Claus in his far-off home and upon his probable 1920 method of chimney-descending, while roasting chestnuts and apples and popping corn enthusiastically meanwhile.

And being that we of this farm are dairy farmers first, last, and always, it is not strange that the cows have always been remembered at holiday time by the smaller members of the family. Ever since our little Ann was able to cut out, she has spent several happy days in December fashioning paper stars and streamers for the stanchions, which kindly attentions, let us hope, are properly appreciated by the black and white pure-breds. I remember that the story of the Christ Child's birth made a profound impression on Ann at the first telling, and she couldn't ask enough questions about the lowly stable in which He was born—a stable where cows, perhaps just like ours, made room for His mother to sleep. So because it was cows instead of some less familiar animal that shared in the honors of our first Christmas night, the divine story has a more personal meaning to little dairy farm folk than it can possibly have for less fortunate children. Therefore it should be told often and the cows and stable emphasized—if our children are to properly appreciate that Christ Himself was once a little child just like them, but born in a stable instead of a house.

We sometimes envy our city cousins at this season of the year—envy them their luxurious shops and rich gift displays to tempt the limp pocketbooks of the poorest. And we envy them the Christmas atmosphere and the fine free music and all that goes to keep Christmas in our modern metropolitan cities. But there is no need. We have so much more than they in spite of their expensive, artificial ways. Every farm in America can contain the heart of Christmas if we only wish it so; it isn't the bright lights and the expensive store things which make Christmas. For the farm from time immemorial has been chosen by the city-tired and blase for the observing of this best day of all, and if the most discriminating of them can get out to the farm for the holidays, you always see them doing it.

Somehow Christmas is sweetest of all spent on the farm. It is the treat of the year to take a sleigh ride from town into the country, and then the hours not passed in front of the red-hot heater or watching the fireplace blaze are fun indeed—coasting or skating or straw-riding—sports worthy of kings and not to be had in the congested centers for love—but money.

Then the Christmas dinner never tastes quite so good as it does when some skillful, deft farm wife prepares it with her own hands. Our city cousins hand the palm to us on these eventful eating occasions without a dissenting voice. The Thanksgiving and Christmas dinners, all raised and grown on the farm, are typical American habits which can't be equaled in any other country anywhere. The bursting-fat hens and roosters, the mammoth turkey, the tender goose or ducks, or perhaps a sucking pig or a great savory sparerib, or leg 'o lamb—any of these we can choose for our Christmas dinner and the more ceremony there is about it, the longer the kiddies will remember Christmas as it ought to be kept today. But one can't make a Christmas dinner from meat alone, even if that is the piece de reistance of the feast, and we farmers' wives know it full well. So for a week beforehand, especially if hungry guests are expected, the farm kitchen is a little fuller of business than even that busy place usually is. The pies—tasty things—of pumpkin, mince, cranberry, and apple; vegetables from squash to silvery onions; crusty rolls and home-made cheese and jellies and pickles and conserves: rich fruit salads and the big butternut cake and sugary doughnuts and spicy cookies—the delectable list is legion, and, to top off with, plenty of aromatic coffee with honest-to-goodness cream, and—best of all—great schooners of fresh cows' milk which, if the city kiddies could drink them, would change their ideas entirely of city milk compared to real country milk.

When we observe the holidays on the farm in such manner, we are doing a lot toward making life more attractive for each and all of us. The "eats" are not the only attractions, however, for the holiday spirit is very necessary and best by far.

On our big dairy farms, so busy and oftentimes burdened with cares and heavy responsibilities, we should nevertheless take time to keep Christmas if other days have to be passed up. Every farm child—and most farms have their children, thank goodness—is entitled to an old fashioned Christmas and the more he does to make that kind come true himself, the happier he will be and the more he will enjoy his own special day. I believe in aiding and

THE CHILDREN HANG THEIR STOCKINGS IN FRONT OF THE LIVING ROOM FIREPLACE AND AFTER THE "GRAND OPENING" DEPART FOR THE BARN TO PLAY SANTA CLAUS TO THE CALVES IN THEIR GAILY DECORATED PENS

The Best Dairy Breed

"WHICH is the best breed?" Very few questions have been asked a greater number of times and no other one has been so universally unsatisfactorily answered. More than thirty years ago this publication made the statement: "The most profitable dairy cow does not belong to any one breed. At least it has never been demonstrated that she does." The substance of this has since been given many hundreds of times to beginners with purebreds, and to old-timers who want to back up and start over. Usually the inquirer does not believe this. He cannot understand how one who is familiar with all breeds has failed to pick a "best one".

For when Bill Smith and his boy have threshed out the question and young Bill has shamed and coaxed and finally threatened to leave home unless better cattle are kept, they want action. Having already waited twenty years or so to begin with purebreds, they don't want to waste any time in choosing a breed. When Bill "takes his pen in hand" and writes his dairy paper the simple question, "Which is the best cow?" he is disappointed to receive the oft written reply, "There ain't no sech animal."

So, his editor having failed him, he chooses a breed. Maybe he likes the color of a certain "kind o' cow". Perhaps he chooses because of size or disposition or because some persuasive neighbor argues him into a decision. Sometimes he takes a certain breed because his neighbors have it, though nearly as frequently a breed finds favor with him because his neighbors do not have it.

Which One do You Like?

There are a number of factors worth considering when a choice is necessary. Any one of them may be a sufficient reason for choosing a particular breed, and if Bill Smith and his boy study them all intelligently, they have a good basis for deciding which is to be the breed of their choice. For, while it may not be said in general that any breed excels all others, it cannot be doubted that under the particular conditions of the Smith farm some cow has the qualities to meet the requirements so well that for the Smiths, at least, she is "the best cow".

If a man is prejudiced for a certain breed so he cannot give fair consideration to the virtues of others, his choice is made. Even though another were better suited to his use, it is time wasted to try to persuade him of its superior points. If he has "hankered" for a herd of certain colored cows for years, no other breed will suit him so well and it is doubtful if another would bring him equal profits. Probably more men choose a breed for the rather indefinite reason that they "like it" than for any other. There is no argument which will shake a decision made on this basis—the opinions of others and all the arguments in the world are of no consequence. It may be said, however, that such men usually have sufficient enthusiasm for such a choice to be successful even under adverse conditions.

Geographic Adaptability

The claim used to be made frequently that certain breeds were better adapted to some particular section than others. With that proved, the choice of a breed might be made by a man's post office address. If he lived in Maine or Georgia, for example, climatic conditions would automatically dictate his breed of cattle, or if he lived in rough country a different kind would suit his needs than would be wisely selected if his farm were in the plains district.

It was once held that the Jersey was "tender" and not hardy enough to withstand the cold winters of the northern states, but the Roycroft herd earned its high rank among producing Jerseys in the Upper Peninsula of Michigan and Plain Mary, present Jersey champion, made her wonderful production in Maine. More recently the claim is made that Holsteins are not adapted to southern conditions. Nevertheless many black and whites are doing splendidly there. Where they have failed to make good, the factor limiting their production was in most cases underfeeding. Also, Ayrshire enthusiasts assert that their cow is best qualified for use in rough lands; that she is a hardy grazer. Yet it is well proved that any cow must be well fed before her milk flow commands much attention and that it is not profitable to force milking cows to gain their livelihood on indifferent grazing. It appears, therefore, that a study of geography is not important in deciding upon a breed.

What is Your Market?

The market may determine the breed. Profitable sale of milk, either for city retail or to those cheese factories which do not buy according to test, may require quite a different animal than where the products of the dairy are manufactured into butter. If a basal price is set for 3.5 per cent milk and a premium of $.40 per pound is paid for butterfat in excess of this requirement, for example, a Holstein breeder supplying a product averaging a content of 3.4 to 3.6 per cent has a marked advantage over a breeder of Jerseys whose milk tests 5.3 to 5.6 per cent fat. On the other hand, where the market prefers a fat content close to 4 per cent, the Holstein with a test of 3 to 3.2 is in less favor. The rich color of Guernsey milk gives it popularity with those who can build up a select trade which is often willing to pay a good premium over the usual market price of milk. Ayrshire milk testing 3.8 to 4 per cent finds special favor with many dietitians and makes strong claim to special advantages as certified milk.

When it comes to quantity production of butterfat, the equality of the capacities of the breeds is remarkable. There is some difference in the cost per pound, however. In public tests the high testing breeds have been somewhat more economical in making butterfat. In the Wisconsin cow competition where figures were taken under farm conditions the advantage of the Jersey over the Guernsey was slight but over the Holstein it was of considerable importance. But in most public tests the advantage shown has not been sufficient to indicate a great difference in economy under every day farm conditions. And balanced against this is the greater quantity of milk credited to the lower testers. The fact that one breed or another holds certain records gives little indication of what may be expected in Bill Smith's barn.

Market Price of Breeds

The market value of the different breeds is a question to consider. Holsteins and Guernseys are the best sellers. To the beginner that may or may not be an advantage; while he can dispose of surplus breeding stock at the best prices, that doesn't help him much in starting a herd. For $1,000 he can now secure nearly twice the production value in Jerseys, Brown Swiss, or Ayrshires, for a yearling Holstein or Guernsey heifer which would cost $300 to $350 can be duplicated in butterfat capacity in one of the other three breeds for $175 to $200. If immediate yield at the pail is the prime consideration in the establishment of a pure-bred herd, the lower priced breeds unquestionably offer the best opportunity to the beginner with a limited amount of money to invest. If the sale of breeding stock is the goal, the beginner must take the gamble with all the rest as to the relative prices which will be paid for various breeds in the future.

Some excellent opportunities are sometimes offered in the purchase of an entire herd or of a few animals at low prices. When such a chance favors a man he does well to make that his beginning, irrespective of the particular herd book in which the animals are registered.

What do the Neighbors Own?

Here is the real basis for a choice, "what do the neighbors own?" If the predominant breed in the locality is registered with the American Jersey Cattle Club, there is likely a good reason for its popularity in the community. Innumerable instances illustrate the folly of simply choosing "something different". No one is more lonely than a single black and white breeder in a Guernsey neighborhood, and no one has more handicaps in his struggle to success than a lone Jersey owner in a section where the Brown Swiss cow is in predominate favor.

In a community where one breed is greatly in the majority, the beginner who makes his start with it falls heir to advantages he cannot otherwise have. Buyers are drawn there by the numbers of the breed which can be seen, so that surplus stock brings good prices at private or public sale. Better bulls are available for use than the beginner can afford to own; a bull association can be organized. A local breeders' association brings its benefits; benefits which must be measured in more than direct returns. There is encouragement and stimulation in joining together in the promotion of a single breed—which the man with "something different" fails to receive. A beginner may wisely be guided in his selection by the results of a "cow census" in his neighborhood.

These several considerations are important to the man who would discover which is the "best cow" for his farm: "which one do you like", "what is your market", "market price of the breeds", and "what do the neighbors own". And of these, the last is by far the most important.

The Ayrshire — Type, Health, Persistent Production

THE Ayrshire is the Scotchman's idea of perfection in a dairy cow. Her native home is in Scotland, in the shire of Ayr from which she gets her name. There she grazes the "banks and braes o' bonnie Doon", produces milk with much more than proverbial Sotch liberality, and sells to American importers at goodly prices.

Origin

Though the youngest of the dairy breeds, the exact origin of the Ayrshire is not known. While there was much dairying in Ayr as early as 1700, the cattle of the district of that day were described in 1750 as "small, black and white, ill-fed, ill-shaped, and producing but little milk". About that date, improvement began through the introduction, according to disagreeing historians, of Shorthorn, Holstein, Jersey, and even West Highland, Hereford, and Devon blood. Cosmopolitan in her ancestry, she seems to have borrowed a little here and a little there, choosing the excellencies of the different strains of cattle from which to build her present-day perfections.

Environmental conditions gave the Ayrshire vigor and hardiness. To subsist on the grasses of the rough pasture lands of Scotland required nimbleness and withstanding the chilly winds in a cool climate gave a ruggedness which is characteristic of the breed. Much cheese is made in Ayrshire, which must have been an influence in securing a medium content of fine globuled fat in the milk, making it well adapted for cheesemaking.

First Ayrshires in America

America's first Ayrshires were brought to Canada early in the past century. Later extensive importations have been made to the Dominion. Claim is made that the first animals of the breed in the United States came to Connecticut in 1822 and it is known that the Massachusetts Society for Promoting Agriculture brought over one cow in 1837. Frequent shippings have been made to the present date, important importations being made in recent months. At no time have large numbers been brought over.

The nature of the breed's distribution in America is well stated by Professor C. H. Eckles when he says, "The Ayrshires have never been boomed or even well advertised in the United States, and their increase in popularity has, therefore, been entirely on their merits." To a great extent the red and white cow has stayed in New York and New England, thriving on the hilly lands of the East. Though it is said the first dairy cattle in Ohio were Ayrshires, they did not gain an important place there or in other states of the Middle West. A few herds have grown up on the western coast, but the chief promotion of the breed has been along the Atlantic.

A very healthy activity has come about in the Ayrshire Breeders' Association during the past four years which promises to give the Ayrshire cow the popularity her merit deserves. Her characteristics well adapt her to the dairy farms of many sections where she is now little known. She is now fourth in numbers among the dairy breeds.

Characteristics

The Ayrshire is the happy medium of the dairy breeds—she reaches no extreme. She is neither unusually large nor small; her milk is not the richest, nor yet the lowest in fat test; her adaptation is to average dairy conditions. She is the "in-between" cow of the five breeds.

Ayrshire cows weigh about 1,000 lbs. and the bulls from 1,400 to 2,000 lbs. The color is white and red or brownish-red verging on mahogany. The typical New England Ayrshire is red with only a little white, but the more popular color in other sections, particularly with showyard individuals, is white with only a little red about the head and neck, with a few spots scattered over the body. There is a tendency for the breed to carry a little more covering than is approved in the Jersey, there being more smoothness over the shoulders, along the back, and in the rear quarters. This characteristic, rapidly becoming less pronounced, no doubt persists from the type of those years when considerable attention was given to dual-purpose values. It is excused or approved by breeders on the claim that it lends strength and constitution to their animal which cannot be had in the extreme dairy form. The horn is characteristic, being long and curving outward, upward, and slightly backward. The top line is very strong, the rib deep, the chest full, the barrel large, and the legs straight and strong. The udder is the most perfect of the breeds, attached high behind and well forward and having a flat sole with the teats well placed. The short teat so much objected to in the Scotch type years ago is now seldom found. Ayrshires are prepotently typy. They breed true to form. There is no lover of perfection in animal form who is not strongly attracted by the lines, the vigor and character, and the perfection of udder of the Ayrshire.

Auchenbrain White Beauty 2nd, owned by Penshurst Farm, Pennsylvania, has been selected by several college professors as the best model of a dairy cow. Lessnessock Dairy Loudoun, owned by Wendover Farm, New Jersey, had sufficient type to enable Bob Hildebrand to make what is said to be his most beautiful photograph. It appears on this page. For four years at the National Dairy Show, the Valentine trophy was offered for the best typed cow of all breeds. Ayrshires won it for three years; Kilnford Bell 3d, owned by Adam Seitz of Wisconsin, taking it the third and fourth years.

Ayrshire Longevity

The Ayrshire is notably long lived. She matures a little more slowly than the Jersey or Guernsey, is frequently at her best at ten or eleven years, and continues in profitable usefulness to a greater age than the average of the other breeds. Jean Armour at eleven years produced 20,174 lbs. milk, 774.73 lbs. fat, and, at fourteen years, 10,936 lbs. milk, 436.46 lbs. fat. Lenetta, milking now as a twenty-year-old at the rate of 10,000 lbs. of milk for the year, made 11,450 lbs. milk, 411.14 lbs. fat at nineteen years and 10,814 lbs. milk, 367.71 lbs. fat at seventeen years. Her fifteen and fourteen year milk records average 12,000 lbs. Crimson Rambler has a ten-year average, and Culcraigie Jeanette one for nine years, of over 10,000 lbs. of milk.

The breed is vigorous. Calves are on their feet soon after being dropped and are easy to raise. They do not need hot-house care. It is well proved that the cows are good grazers, managing a livelihood on rough hillsides and places of scanty pasturage where other breeds could not subsist. Unfortunately this fact has placed the breed in the hands of some men who do not feed liberally and who have not given it the opportunities every dairy cow requires if she is to produce well. The vigor of Ayrshires tends to make them disease-resistant and contributes to their longevity and persistency of production. It is in a measure accountable for the excellent reproduction records of Ayrshire cows. They are regular and sure in their breeding, dropping strong, healthy calves year after year.

LESSNESSOCK DAIRY LOUDOUN, THE AYRSHIRE COW WHOSE PERFECTION OF TYPE ENABLED BOB HILDEBRAND TO MAKE HIS MOST BEAUTIFUL ANIMAL PHOTOGRAPH

Milk Average in Fat Content

Ayrshire milk averages a fat percentage of 3.85 to 4. The fat globules are small. The average composition and the small globules adapt the milk to market milk sale, though it would be more accept-

(Continued on page 1007)

The Brown Swiss—The Oldest Dairy Breed

THE Brown Swiss is the world's oldest dairy cow. When the ancestors of the other present day milk breeds were yet wild—small, ill-formed, and giving little promise of ever serving mankind, the mountainsides of Switzerland prospered from the production of Brown Swiss. In early performance, she set a world's record. Other breeds have claimed to fill a dual-purpose but she for hundreds of years cheerfully lived up to a triple-purpose—a three-job requirement. She furnished the Swiss their meat and a bountiful supply of milk, and at the same time hauled the loads of the farms and pulled the plows of the fields. She filled this place for centuries and well deserves the reputation so faithfully earned of being extremely docile and tractable.

Brown Swiss in the United States

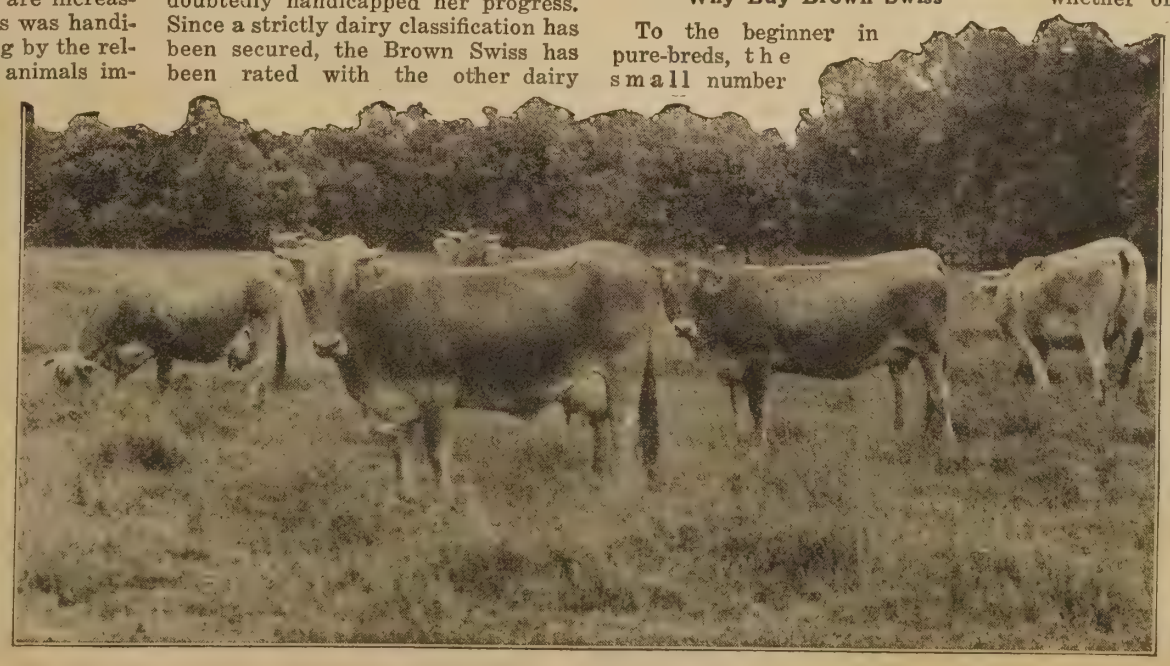
H. M. Clark of Massachusetts is credited with bringing the first Brown Swiss to this country; eight head in 1869. An eastern importing company brought over ten more in 1882. Other small shipments came from time to time, quarantine restrictions keeping the number down. McLaury Brothers of New York in 1904 obtained one of the important later lots. Two years after that E. M. Barton of Illinois secured thirty-nine head whose quality made the importation the greatest ever received.

The Brown Swiss is the least numerous in this country of the five dairy breeds. About 20,000 animals have been recorded, and probably not more than half that number are now on American dairy farms. New England and New York State have the great percentage of the breed, though herds in the middle west are increasing. The breed's progress was handicapped from the begininng by the relatively small number of animals imported, the total being less than 200 head. But a factor of more influence is the character of the man into whose hands the breed has fallen. Farmers own it—men who gain their livelihood from their herds and crops. A meeting of Brown Swiss breeders brings together a greater proportion of men who themselves milk cows than will be seen in the conclaves of any other breed. This is a disadvantage as well as a commendation, for these men have neither the time nor the inclination to boom their breed. Under farm conditions the cows have established their high worth as generous and economical producers. There has been no promotion work. Whatever progress has been made must be credited to the cow's good qualities.

Characteristics of the Breed

The system of caretaking in Switzerland has strongly influenced the breed's characteristics. For draft purposes a large, strong animal was required; exposure to the weather for a number of months each year contributed to the breed's hardiness; and the large proportion of roughages in the ration developed a great capacity for handling feed. Brown Swiss are large. The cows weigh 1,200 to 1,400 lbs. and the bulls, 1,500 to above 2,000 lbs. Many Brown Swiss are not brown. Variations in color from silver gray to so dark a brown as to be nearly black are allowed, though a mouse color is preferred. A creamy ring surrounds the mouth and a light stripe usually follows the backbone. White spots, except on the underline near the udder, are very objectionable.

The Brown Swiss cow is not beautiful, except in the fulfillment of the adage, "Handsome is as handsome does". She tends to heaviness and is somewhat plain but is well proportioned and substantial looking. She is a bit slow in maturing, ranking about with Holsteins in this respect. The head is large and throaty and the neck thick. The hind quarters are rather meaty and the general appearance of the animal is more blocky than the form generally accepted as characteristic of a milking animal. Many are faulty in the fore rib, lacking spring, but the barrel is large and of good depth. Critics fault the breed for coarseness, yet the bone is of firm texture and not too large, the handling quality is excellent, and no breed has a superior texture of udder. The shape of udder will bear improvement, though the size is acceptable and the teats of good shape and size.



Until 1906 American breeders made the error of seeking a dual-purpose function in this cow, which undoubtedly handicapped her progress. Since a strictly dairy classification has been secured, the Brown Swiss has been rated with the other dairy breeds and marked improvement has been brought about. No one can see the line-up of milking cows in the show ring today without appreciating their strong producing qualities.

The milk of the Brown Swiss is medium in its content of butterfat, the percentage being about 4. This suits it admirably for market milk and for cheese making, the product into which goes so great a part of the breed's production in Switzerland. In that country, the average yearly per capita consumption of cheese is 26.4 lbs., twice as much as the average eaten per person in any other country. The breed ranks high in its average production. At the school of agriculture at Zurich, Switzerland, the Brown Swiss herd for 30 years made 7,500 lbs. milk, containing 3.44 per cent fat. Twenty cows near Luzern averaged 8,400 lbs. milk for three successive years. Six thousand cows supplying the Anglo-Swiss Condensed Milk Company, milked 9 months of the year and fed only hay and grass, averaged 5,115 lbs. of 3.68 per cent milk, according to the United States Consul at Zurich. The Brown Swiss cow, Brienz, completed the largest public record ever made by producing in three days in a public test at Chicago 245.1 lbs. milk containing 9.32 lbs. fat. Last year in Cow Testing Association No. 2 of Lake County, Illinois, the herd of 44 cows on Hawthorn Farm averaged 10,080 lbs. milk, 429 lbs. fat. The cow, Merney, in 1909 in the Wisconsin Experiment Station herd, representing the different breeds, produced 13,653.7 lbs. milk, 554.19 lbs. fat, and made a greater net profit than any other of the 35 cows. On the basis of maximum records, the Brown Swiss has not ranked high, the best production being that of 19,460.6 lbs. milk, 789.16 lbs. fat, made by College Bravura 2nd owned by the Michigan Agricultural College. But the average of the breed is, as Secretary Ira Inman says of the Hawthorn Farm average, "Something to shoot at". All registry records completed for all ages average 10,939.5 lbs. milk, 437.08 lbs. fat.

Why Buy Brown Swiss

To the beginner in pure-breds, the small number of breeders of Brown Swiss constitutes a disadvantage. In a small breed, association affairs move slowly; there is too little publicity; the opportunity for selection in buying is limited; and it is very difficult to create a demand which will take surplus at good prices. The isolated breeder is far less favorably situated than one in a community where many men own the same breed. A very serious fault of the breed in the eyes of many is the tendency to coarseness in both cows and bulls. To those accustomed to dairy type as represented in the form of the Jersey, the heaviness about the head, the throatiness, and the general tendency to coarseness are incompatible with the tendency to turn feed to milk rather than to bone and beef. But even considering this, the Brown Swiss has qualities which command favorable attention. She is a big, strong, hardy cow, qualities in favor on the majority of farms. She is uncommonly docile and by inheritance is fitted to utilize much roughage advantageously. She is exceptionally long lived and is sturdy and hardy. Relatively few Brown Swiss cows fail to breed, the characteristic of the breed being to drop calves regularly to a good age. So strongly is she bred that her sons crossed on common herds sire grades very similar to pure-breds in appearance, transmitting size, vigor, and the power to produce profitably for many years. Numerous claims have given the breed a high rating in economy of production. Few public tests substantiate these claims but it cannot be doubted that the Brown Swiss cow gives a good account of the feed she consumes.

Brown Swiss calves are healthy, very large at birth, and easy to raise. The average weight at birth is around 100 lbs. and 125 lbs. is not uncommon. W. E. Janes of New York states that Benny Blanc weighed 155 lbs. at birth and 795 lbs. at 6 months. The calves not saved for breeding veal to a good profit. It is claimed, whether or not it is an advantage, that in a herd of ten cows the veals sold will pay for a new sire each year.

The proved qualities of the animals of this breed guarantee them a place on the dairy farms of America. Though they have thus far occupied a small part in the dairy husbandry of this country, their owners are optimistic that the future will bring a greatly increased popularity of the Brown Swiss as the farmer's milk cow.

The headquarters of the Brown Swiss Cattle Breeders' Association of America is Beloit, Wisconsin. Ira Inman is secretary.

The Guernsey—The Quality Cow

MARY Marshall gave the Guernsey cow her initial popularity with the American farmer. Her performance at the Pan-American Exposition in 1901 called first attention to the virtues of the "old yellow and white cow." In a six months' public test, with ten breeds competing, the Guernsey produced butterfat at the lowest cost, and made the greatest return for each dollar invested in feed. Fifty cows were entered, five from each breed. Three of the top five were Guernseys and the leader of all was Mary Marshall.

Rueben Haines of Pennsylvania imported the first Guernseys to this country as early as 1818. Fifteen years later a bull and two heifers were brought to Cow Island, New Hampshire. A few herd foundations were secured in the seventies but, when the herd book of the American Guernsey Cattle Club was started in 1877, only 193 animals were registered, 114 of these being imported. Not until 1880-90 were important importations made and the largest shipments have come since 1900. Up to 1901, when Mary Marshall's notable victory drew favorable mention, the breed had not come into great favor with the dairy farmer.

Island of Guernsey Her Origin

The yellow and white cow takes her name from the place of her origin, the Island of Guernsey. The purity of her breeding there since 1819 is made certain by a law passed at that time preventing the landing of cattle on the Island. It is thought that, for at least a century before, no new blood was introduced except slight infusions from the Island of Jersey. The breed's progenitors are said to be the small black cattle of Brittany and the larger red cattle of Normandy, the blood of the latter predominating. One theory of its origin includes among its ancestors the spotted cattle of Switzerland, the Simmenthaler. Evidence of this is seen in the breed's size, quiet disposition, and yellow secretions. The Guernsey has her present perfections through long continued selection from the native stock of over a century ago. Annual exhibitions have contributed greatly in establishing her present distinctive characteristics.

The Guernsey Character

The Guernsey carries the marks of a milk cow. So pronounced is her dairy conformation that no one can mistake the purpose for which she is developed. She is clean of flesh, open in frame work, great in her ability to use feed, strong of constitution, equipped with a milky udder of good size and quality, and is a cow of scale and capacity. She has dairy temperament a plenty; is alert without being nervous. She is larger, rougher, and coarser than her sister breed, the Island Jersey; having less of beauty but more of the appearance of utility. Her head is sometimes plain, her back not always straight, and roughness in the rump is common. She ranks with the Ayrshire in size, the cows weighing 1,000 to 1,100 lbs. and the bulls from 1,500 lbs. to a ton.

The deep yellow color of her milk is the most characteristic quality of the Guernsey. Indication of this is found in the heavy, oily secretions of the skin, most noticeable in the ears, on white spots, and at the end of the tail. The average production is 5,500 to 6,000 lbs. and the test right close to 5 per cent. Persistency of production in an unusual degree is had in the Guernsey. She holds her milk flow throughout the year, in her records frequently producing as heavily at the end of the year as at the beginning. The breed's color is also distinctive, orange-yellow and white being typical. The amount of either may vary, even to the exclusion of white, though too much white is objectionable. The breed is not especially early maturing, ranking between the Jersey and Holstein.

The Guernsey's worst fault is in her breeding qualities. There are many herds where this criticism does not apply, but, on the average, the reproductive powers of the breed constitute its greatest weakness. Calves weigh 65 to 70 lbs. at birth and, comparatively, are not easily raised. Another Guernsey shortcoming is a lack of uniformity in type. Marked improvement has been made in late years but there is still much to be done in establishing a characteristic conformation.

At Her Best in America

The Guernsey is at her best in America. She is larger and more capacious than the typical representative on the Island and produces more liberally. Recognition of her superiority here is given in the sale ring where she greatly outsells an imported animal. The exception to the rule in the wise policies of the American breeder is the foolish fancy which causes the rejection of worthy animals because of black noses. The buff nose is preferred to the extent of greatly reducing the value of a calf because four square inches of skin happen not to be of a certain hue. This, in the face of such authoritative statements as that of Joe Hope's, "I take no exception to a black nose, for I am well satisfied that it is a mark of superior ancestry."

The breed makes its claim to a place on the American farm on the basis of production, quantity, quality, and economy. At the New York and New Jersey Experiment Stations she was compared with three other dairy breeds and made butterfat at the lowest cost per pound. At the Pan-American Exposition where the only public test with all the dairy breeds was made, she excelled all of the nine other breeds in economy of butterfat production. Mary Marshall, a ten-year-old Guernsey, won the test with a production in 6 months of 5,611 lbs. milk containing 301.13 lbs. fat. Not only were the Guernseys most economical in their use of feed but their butter was given the highest score, leading in flavor and in color.

The first Advanced Registry system for yearly production was that established in 1901 by the American Guernsey Cattle Club, and the first Advanced Registry cow and bull in America on the basis of 365 day records were Guernseys. The 9,186 records completed May 1, 1920, averaged 9,042.91 lbs. milk, 452.57 lbs. fat. Three of these were world champion productions; that of Yeksa Sunbeam in 1905 of 14,920. lbs. milk, 857.15 lbs. fat; that of May Rilma in 1914 of 19,673 lbs. milk, 1,073.41 lbs. fat; and that of Murne Cowan in 1915 of 24,008 lbs. milk, 1,098.18 lbs. fat.

Guernsey on Jersey Domain

The Guernsey has fallen heir to much of the old Jersey domain. Her greatest numbers are in New York, New England, Pennsylvania, and Wisconsin. She holds favor in the newer dairy states of the Middle West and now begins to usurp southern Jersey territory by way of the Carolinas and Virginia. The dairy farmer, always a stickler for size in his milk cow, gives much emphasis to this quality. He considers the Guernsey more hardy than the less-favored Island cow of her sister-breed, and chooses her in northern states because of this and also in the belief that she makes larger returns from the abundant roughage crops of the farm.

A Quality Cow

The Guernsey's is a quality product, in fat percentage and especially in its rich golden coloring. Handicapped where milk sells on a low fat basis, she prospers best where a special trade can be secured. In many sections in the East, her product establishes its own market. She is found in many herds in low testing breeds, where her milk "helps out" the color and fat percentage, a little leavening the whole. She holds her own where cream is sold, where butter is manufactured, and where milk is bought on the butterfat basis.

The Battle With the Scrub

Strong proof backs the advertising of the Guernsey bull as "the winner of the battle with the scrub". No bull sires a better grade cow. Many herds of sizey, open-framed, milky grades, producing richly colored milk in bounteous quantity, mark the farms where the daughters of the old red native cow have been mated with sons of the "old yellow and white cow". Notable productions are made by grade herds and individuals have completed justly famous records of persistency and profit. As long ago as 1897 a Wisconsin Guernsey grade began an eleven-year production averaging 8,943 lbs. of milk, 467.7 lbs. of fat.

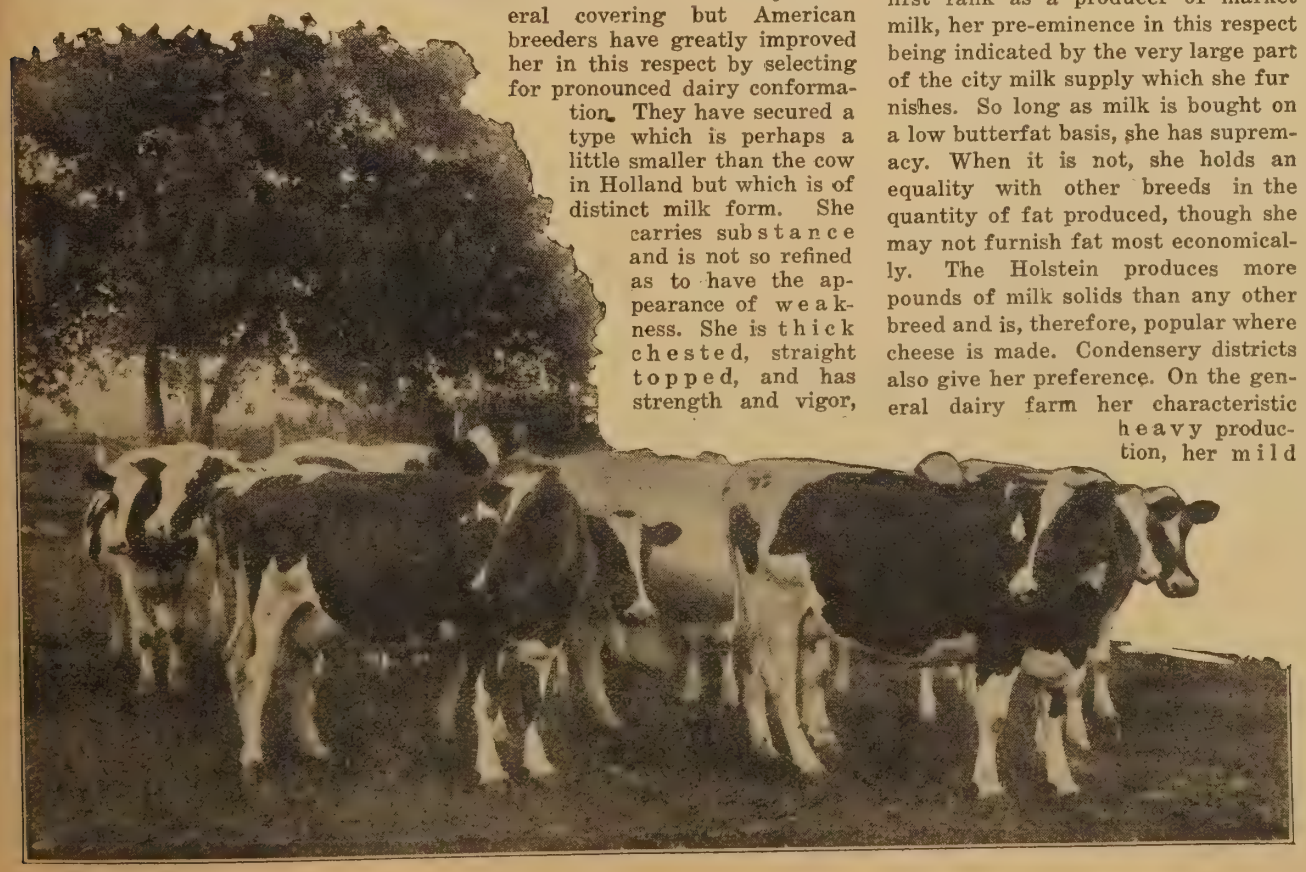
The progress of the Guernsey cow since 1900 is a striking commendation of her worth. Almost unknown to the dairy farmer then, she now ranks high in popularity. In twenty years there has been an increase in registrations totalling eight hundred per cent. Even now she ranks third among the breeds in numbers and finds the chief limit in her spread in this fact. She is in demand at prices not exceeded by those of any other breed; the policies of her owners are progressive and constructive. The national association has been conservative in its policies but progressive, constructive, and at all times a very strong influence in promoting the breed's good. Lately its extension forces have been greatly strengthened.

The headquarters of the American Guernsey Cattle Club is Peterboro, New Hampshire. W. H. Caldwell is secretary.

The Holstein—Heaviest Milk Producer

IN the days when the shepherds of Judea journeyed to Bethlehem at the direction of the angel of the Lord and returned to their flocks glorifying and praising God for all the things that they had heard and seen, there were herdsmen far to the northwest caring for the cattle now called Holstein-Friesians. Three centuries before the birth of Christ, a people known as the Friesians settled with their flocks and herds of white cattle north of the River Rhine in what is now Holland. Two hundred years later the Batavians came bringing black cattle. These, crossed on the herds of the Friesians, gave the ancestors of the modern black and white cow.

The Holstein, two thousand years after her origin, reflects the environment of Holland. There she fed for centuries on the abundant succulent roughages of the fertile lowlands reclaimed from the sea by dykes. There she developed into a large cow of great capacity, with the strength and vigor necessary to heavy milk flow. From generation to generation she has been so handled and fed that authority has said, "The Holstein in her native country is the best cared for cow in the world."



Dutch Brought Holsteins Here

Dutch settlers brought Holsteins to New York State near the beginning of the seventeenth century, some say as early as 1609. The first shipment about which definite facts are available consisted of two bulls and six cows sent by the Holland Land Company to John Lincklaen, Cazenovia, New York, in 1795. The first importation to be kept pure was brought in 1861 to Massachusetts by W. W. Chenery. Between 1875 and 1885 about 10,000 head came over. Few have been imported since that time. The name given the breed, Holstein-Friesian, is the result of a compromise between two rival registry associations which combined in 1885 to form the Holstein-Friesian Association of America. The breed might more properly be termed Friesian, since its origin is principally in the Holland province of Friesland.

As 1920 ends, nearly 1,000,000 Holsteins have been registered in America. It is estimated that more than 400,000 of these are now alive. The same estimate places the total number of breeders at 35,000, of whom 17,815 were members at the end of the association's last fiscal year. Herds of the breed are found in every state in the Union, in largest numbers in New York, Wisconsin, Pennsylvania, and Ohio.

Holstein Characteristics

The Holstein is the largest of the dairy breeds; the cows averaging about 1,200 lbs. and the bulls 1,800 to 2,200. Individual weights greatly exceed these. The color must be black and white, sharply defined and not blended. An animal may not be entirely white or all black and be registered. There is now a popular demand for a large proportion of white, those animals which are mostly black being discriminated against somewhat. This fad has no relation to productive capacity. As imported, the Holstein was inclined to carry a liberal covering but American breeders have greatly improved her in this respect by selecting for pronounced dairy conformation. They have secured a type which is perhaps a little smaller than the cow in Holland but which is of distinct milk form. She carries substance and is not so refined as to have the appearance of weakness. She is thick chested, straight topped, and has strength and vigor, capacity for handling much roughage, and a mammary system which turns out phenomenal quantities of milk. Her milk is light in color, the fat globules very small, and the fat percentage 3.4 to 3.5. Her calves average about 90 lbs. at birth and are vigorous and very easily raised. They make heavy veal weights very early. Holsteins mature slowly, coming to producing age several months later than the Jersey or Guernsey.

Some Faults in the Breed

Faults in the form of the Holstein are greater in number than in importance. She is too often a bit thick in the thighs and shows too great tendency to beefiness; she is apt to be a trifle coarse in hair, bone, and skin, and seems to lack quality and finish. Upstanding, shallow animals and those with sloping rumps and pendent udders lacking fore extension are yet found, though they are becoming less and less common. Her milk is never too rich in fat, but the occasional member of the breed which almost forgets to put fat in imposes too much on a public which likes a "low down cream line". The man who objects to typical Holstein milk, however, because too much has to be milked and cared for to supply a required quantity of fat, has his counterpart in him who objects to alfalfa because there is so much to harvest. Even with these faults, which are rapidly lessening, the Holstein cow well fills the requirements of the farmer who declared his cow must have two things, "a place to hold feed and a place to hold milk".

The Holstein is the world's heaviest milking cow. Her milk, though low in fat, is produced at a lower cost than that of any other breed. She holds first rank as a producer of market milk, her pre-eminence in this respect being indicated by the very large part of the city milk supply which she furnishes. So long as milk is bought on a low butterfat basis, she has supremacy. When it is not, she holds an equality with other breeds in the quantity of fat produced, though she may not furnish fat most economically. The Holstein produces more pounds of milk solids than any other breed and is, therefore, popular where cheese is made. Condensery districts also give her preference. On the general dairy farm her characteristic heavy production, her mild temper, and her adaptability give her high standing.

If Records Told the Story

If world champion records told the story, the Holstein would have everything her own way, for the black and white cow has the highest fat production in every class of the Advanced Registry, from junior two-year-olds to mature animals. In the seven classes the top Holstein records average 1,035.43 lbs. fat; and those of the closest competing breed, 918.94 lbs.; in milk, the seven Holstein records average 28,271.8 lbs., which is 8,380.4 lbs. above the next highest breed average. The ten highest records of the breed average 1,105.86 lbs. fat and the best ten of the breed ranking next, 997.6 lbs. A Holstein cow has made 1,205.08 lbs. fat in a year, another has produced 33,425.3 lbs. of milk. Much attention has been given to the seven-day test. Now the leading breeders are giving increasing emphasis to the 365-day record and placing less faith in the value of the short time test.

The average of the breed is a yearly production of 8,500 to 9,000 lbs. of milk containing 3.4 to 3.5 per cent of fat. The grade in cow testing associations gives a worth while account of herself, in very many instances leading in production. A Wisconsin association, almost exclusively Holstein, averaged 9,034 lbs. milk, 328.6 lbs. fat in the year 1919-20. One herd of 16 cows in this association, part grade and part pure-bred, averaged 13,737 lbs. milk, 502 lbs. fat. Further evidence of the prepotency of the Holstein bull comes from the Iowa State College where grade Holstein daughters of scrub cows produced 94 per cent more milk and 62 per cent more fat than their dams. In the second generation of grades the production of milk was 245 per cent and the amount of fat 168 per cent over that of their scrub grandams.

The future of the Holstein cow in America is well assured. She has more active adherents than any other breed. Her owners are universally enthusiastic over her merits; they are aggressive promoters of their breed. A very liberal extension program is followed by the national association and state organizations are now doing much toward further increasing the breed's popularity. Every Holstein owner is an extension man for the breed—an enthusiast who spares no effort in giving publicity to the excellent qualities of his favorite cow. Her popularity with the American farmer is well deserved. She is the largest dairy cow, makes liberal use of bulky farm roughages, produces more milk and as much fat as other breeds, is a good breeder, dropping large calves which are raised without difficulty, and she exists in such numbers and in such distribution that the farmer knows her and the beginner can make his first purchase easily.

The headquarters of the Holstein-Friesian Association of America is Brattleboro, Vermont. F. L. Houghton is secretary.

The Jersey—Premier Butter Breed

"THE treasure highest in the Jerseyman's estimation is his cow." So wrote the historian more than a century ago. His statement made then, of the breeders on the small isle the Jersey cow put on the map of the world, is true today in all the many countries to which her sterling qualities have taken her. A peculiar sentiment attaches to her ownership as with no other breed. She is the family cow of the world—to countless thousands, the symbol of the dairy industry.

Breed Obtained Through Selection

The year the first president of the United States was elected, the Island of Jersey passed a law against cattle importations which effectively preserved the purity of breeding of its herds. What the Jersey was then, it is now; it has nothing now, through the introduction of new blood, it did not have in 1789. The Jersey cow of the present day is the result of selection from the native stock of the Island critically described by the judges at the first official show nearly fifty years later as "very much out of condition"; "too slightly formed behind and cat-hammed"; "gait, unsightly"; "udder, ill-formed"; "tail, coarse and thick"; "hoofs, large"; "head, coarse and ill-shapen".

The progenitors of the Jersey are not known—the most acceptable theory of the breed's origin makes it an admixture of blood from Normandy and Brittany. Because the cattle of Brittany were smaller, darker, and of more solid color, and with small, black, pointed horns, it is thought these cattle predominate in the Jersey's ancestry. The early improvement of the stock of Jersey over that on the mainland is indicated by Phillip Falle's statement in 1734: "The cattle of this island are superior to the French cattle." It is recorded that from the time of the first show in 1834, "Great attention has been constantly paid to combine beauty of form with butter producing habits."

The Jersey of Today

How great is the accomplishment of the breeders of Jerseys in the past century! The description of 1834 does not define the 1920 Jersey of which Professor C. H. Eckles has written: "A good Jersey cow is the model of what is generally taught to be the dairy form. She has the pronounced wedge shape, an immense barrel for her size, a well developed udder, and does not carry a pound of surplus fat while in full flow of milk."

The Jersey is the smallest of the dairy breeds. The females average 800 to 850 lbs., extreme weights being from 650 to 1,500 lbs. The most common color is fawn, shading to black on the legs and about the head. Animals so light in color as to be nearly white and those which grade from dark gray to black are acceptable. A solid color is preferred, though animals which have white markings may be registered. A black tongue and switch are most common.

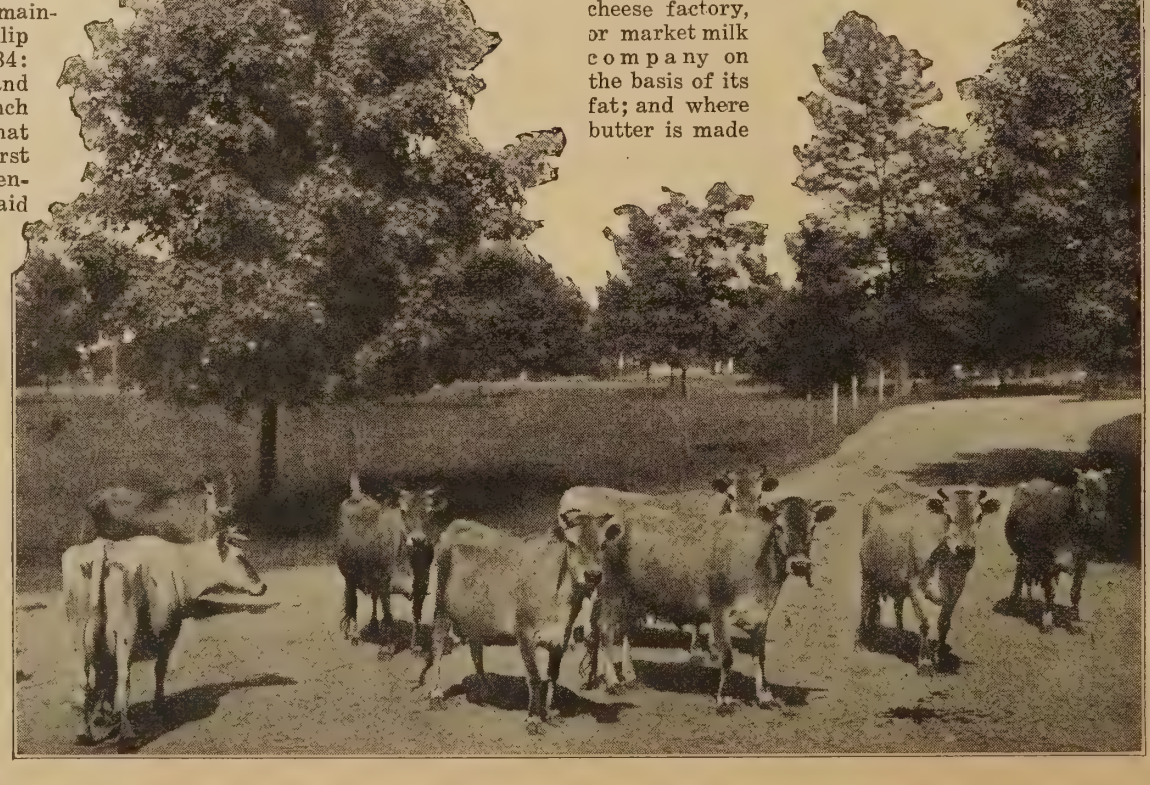
The Jersey is the most highly specialized dairy animal. Her head is clean cut; the neck, long and thin; the shoulder, fine and well blended with the middle; the vertebrae of the back prominent and well apart; the ribs well sprung, giving a large middle; the rump, long, level, and wide; and the thighs, thin and free from extra fleshing. The mammary system, in keeping with the body conformation, nears perfection. The udder is capacious, of good quality, and unusually well attached, especially in front. In the hundred points of the score card, forty are devoted to udder, teats, and veins. Jersey milk is the richest in fat, the characteristic percentage being from 5 to 5.5. The fat globules are larger than those in the milk of other breeds. The average quantity of milk per year is around 5,500 to 6,000 lbs.

The breed matures early, the practice being to bring heifers to milk at twenty-four to twenty-seven months. Jerseys have a high degree of intelligence and the cows respond generously to kind treatment. They are of strong nervous temperament which accounts for their ability to produce persistently year after year, though in general appearance they may be somewhat delicate. The bulls, because of this nervousness, are more apt to become ugly and difficult to handle than the males of other dairy breeds. The calves are small at birth, averaging about 55 pounds, and are not as easily raised as those of three of the other breeds.

The Jersey in America

The first Jersey cow in the United States came in 1815. She was three months on the water, calved at sea, and made 8 lbs., 2 ounces of butter in a week, upon landing, from a production of 14 quarts of milk per day. The first foundation stock was brought in 1850, to Connecticut, by Messrs. Taintor, Buck, and Norton. During the seventy years since that time, except when quarantine restrictions prevented, importations have been made annually.

Following the first importations, the Jersey became very popular; the boom being at its height in the late seventies and the eighties. She gained a strong lead over other breeds, having a clear field. With her dairy qualities and the need in this country for dairy animals, she should have established herself so strongly as to hold her leadership permanently. She has not done this. Although her numbers may not now be exceeded by any other breed, (there are 680,000 registrations) it cannot be said that she is today the cow in greatest demand on the dairy farms of America. The price for which the average Jersey sells, very little above that of grades, points clearly to the breed's failure to come into its full heritage.



Here is the premier butter cow of the breeds. She is without a peer wherever there are consumers who appreciate quality of milk and are willing to pay for it; where cream alone is sold; where milk is purchased by a creamery, cheese factory, or market milk company on the basis of its fat; and where butter is made on the farm. Acknowledged as queen of the dairy farms of the South, she holds forth strongly in Ohio, Indiana, and some sections of New England. But in the great dairy counties of New York State, Wisconsin, and the newer regions taking up the milk cow, she has not held her own.

Handicaps to Jersey Progress

An early color fad injured the Jersey. Fashion decreed that only solid colored animals were acceptable. As late as 1900 many breeders slaughtered at birth, or at best failed to register, those calves which were so unfortunate as to be born with white markings. The small membership in the American Jersey Cattle Club, due in part to the high fee, is a handicap. At the end of the last fiscal year, the Club's membership totaled only 8572, and there are over 25,000 breeders.

The most serious obstacle in the Jersey's progress in America is the disagreement as to what constitutes the correct type—the small, beautiful, Island bred cow or the larger, plainer, coarser, heavier milking cow of American breeding. At present the price standards strongly favor the former, importations bringing auction averages greatly exceeding those obtained for the choicest of American bred animals. The show ring is given up entirely to Island breeds. Under the present standard of judging the typical representative of the American breds has no chance to win. It matters not that the American type produces more milk and fat, that the highest records in every class are held by its members—the publicity from show winnings and high sale prices has at present placed the Island type in the lead.

It is a sad commentary on the American breeder if after three-fourths of a century he must return yet again and again to the Island of Jersey for new seed stock. Col. Geo. E. Waring wrote as early as 1869, "We have here ample material for the development of such herds as the Island of Jersey never saw." Cows of American breeding have well maintained the breed's laurels. Jacoba Irene made 17,253.2 lbs. milk, 952.9 lbs. fat in 1909 and was breed champion for several years. Sophie 19th of Hood Farm next held that honor with 999.1 lbs. of fat in a year. She has nine yearly productions averaging 12,326 lbs. milk, 706 lbs. fat, a world famous record for persistency. Vive la France, for a time champion of the breed with a four-year record of 14,925.7 lbs. milk, 1,031.64 lbs. fat, has

Air Castles On The Farm

Mrs. P. H. Crane

AIR castles? Yes, I'm familiar with them. I have seen so many ruined ones that at first thought it is almost a joke to mention such a thing. When I was in my teens I was so busy building them and they were so shimmering and colorful that I could scarcely make out their lines and they entirely blinded my eyes at times to the dishpan and the broom.

I can see myself now sitting on that log by Riggin's line fence where the wild roses grew so thick—a dreaming, dreaming of the beautiful home all wonderful, with me and a prince in it. I saw myself with my children around me looking like the mother and children you see on the calendars—such a tranquil mother—such angelic children—no trouble to be so. 'Twas a sweet dream.

From that wonderful home we were scattering blessings upon the world freely and without any effort. In my dreaming I saw no road to that glorious, misty place. I just smelled the wild roses and felt estatic.

Some years later, when I found myself dreaming of the future with my husband, the dream took on a somewhat similar form. Our air castle was to have a home where honorable children could grow and to be ourselves of a little use in the world. Then the misty air castle took on more distinct lines and we realized there was a long, rough road between it and us. It takes moral force and some money to grow useful citizens and to be a helpful citizen yourself. We needed to cherish the things that make an honorable citizen and we needed to succeed well enough financially to give that citizen a chance to be useful.

Let it be understood right here that we are only started on the way to the realization of our dreams. Our children are only babies, the oldest 7, and who can say whether they will or will not be useful citizens? And as to financial success, we lack a long way of being out of the woods. Why, our second importation of heifers have not even freshened yet. So as to the value of this, our biggest air castle—to be of use and to train useful children—I can say nothing. But we have gone faster on the road to a competency than we had hoped.

Whoever knows of Crane Bros. knows of the four of us—Perry and Ruth and Vic and Ross—the brothers and their wives. Those who know us at all well know that the boys are usually hatching up some "million dollar idea" as we wives call them. They afford us much diversion, both the ones that fail and the ones that succeed. These are the minor air castles that are helping us to realize our biggest one. It causes me no abashment to speak of them for they have proven to us their value. These air castles were all dreamed while we were awake—very much awake—and usually when we urgently felt the advantage of having some more cash. They were discussed at our common meeting while we milked our Guernseys, if the children were playing a quiet enough game for us to hear our own voices. The hired man was usually getting down silage and could not therefore hear us and be called upon to swear we were all insane.

"I've got an idea," says Vic as he walks down to weigh up.

HOME OF MR. AND MRS. P. H. CRANE AND FAMILY

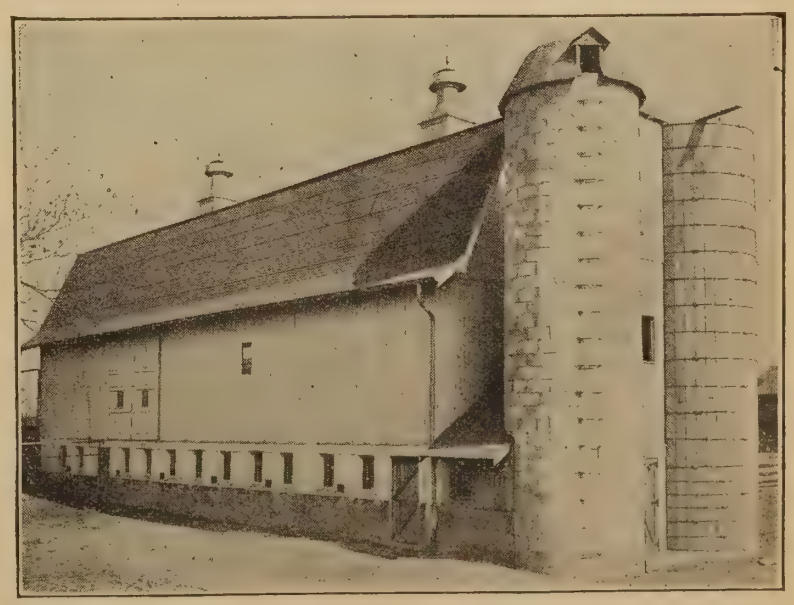
"So? That's nothing new. Is it a hurting you bad?"

And then he tells us how we could surely make money and happiness for everybody concerned if we would just work out that cartoon idea. It sounded good as he explained it, each of us commending or condemning certain features.

"Be that as it may," said a practical wife," it's not bottling this milk or putting supper on the table right now." And the discussion was tabled until another suitable time.

Next meeting, three days later while milking, we pictured out the characters that were to figure in this series of cartoons which would appear weekly in farm papers and teach the readers valuable lessons while making them laugh. We had lots of fun that evening. The air castle was going good. We girls even did the milk house work while the boys went up to the office to give the thing a deliberate going over. We risked $75 to have cuts made of a few weeks' cartoons to send to various farm papers. Then we stopped work on that air castle. Somehow we never found time to send those samples out. It didn't just quite fit into our line of work and the immediate demands of our real business forced the abandonment of this idea. But it left us with a little more experience and a little more fully convinced that we had better stick to our own line of business.

Then there was that air castle about the "Farmers' Mutual Accident Insurance". Does not the farmer run the greatest risks of being injured? He may fall out of a silo or have an arm broken cranking his Ford, or lose a hand in a corn shredder, or have a mule kick a rib loose. And if farmers had a sound company in which to insure themselves as have the traveling men, why wouldn't it work? We figured out what the loss of an arm was worth—an eye—both eyes——a leg—both legs—total disability, etc. And we put our heads together and decided who we would go to first in promoting the thing. But silo filling came on and some way the castle faded away.



Now, that dairy feed idea of Perry's flourished long and died hard. Has he by chance talked it to any of you? You are lucky, then, for we thought he had talked it to every man, woman, and child in the United States nearly. Anyhow, he convinced a lot of mill men and feed dealers around here that it was the most economic and the most practicable thing in the world. Come to think of it, I do not believe I'll tell you all about that project. We might some time run out of an air castle to think about and then we'll just remodel this old one.

In our experience the main value of air castles, like these I have cited, is to furnish entertainment and to stimulate the imagination. We have builded air castles, however, no more promising than these that are of material value to us. As you may have surmised, we are endeavoring to derive from Guernsey cattle and their products the wherewithal with which to procure the object of our dreams.

If the products of our Guernseys were to help us as they should we had to sell them well. If they sold well it must be because people wanted them. If people wanted them they must be good. So we handled our milk and whipping cream and cottage cheese so that we ourselves pronounced them delectable. They were good the first day, the second day, and every other day. They are good yet and our customers know it. But our products might not have had the enviable reputation they have if we had shied at work or had left the preparation of them to the average help we obtain. Our customers have developed a taste for Crane's Guernsey milk. They have standing orders for it at the market where it is distributed. Our only trouble is that we cannot supply the demand. The customer attributes its goodness to Crane's and to Guernseys. It has made them nickname us "Guernsey Cranes". We tell them to thank the Guernsey for its yellow richness and fine flavor and to thank us for its coolness, sweetness, and purity.

Several of our customers are becoming interested in owning the Guernsey because they believe she will do to tie to. A few Lebanon boys have obtained Guernsey heifers through the Boone Co. Guernsey Calf Club.

WHERE "PERRY" REIGNS SUPREME—AND WHERE FUTURE CRANE-FARM AIR CASTLES WILL BE BUILT

Essentials of Successful Co-operation

Eugene Davenport

E. DAVENPORT

IT is with no little trepidation that I accept the invitation of Hoard's Dairyman to write under the above title lest it seem presumptuous for one who has not made a particular study of this highly specialized phase of economic procedure.

But whatever individuals may have done in the study of co-operative farming, the general public is only as yet feeling its way into that kind of co-operation that must characterize the many phases and kinds of successful farming as conditions grow more complicated, and in none will co-operation be likely to figure more prominently or more significantly than in dairying, where it began a good many years ago in the form of the co-operative creamery and cheese factory.

We have much to learn before successful co-operative plans can be worked out for the different phases of farming, from dairying to fruit raising, and some of our failures add emphasis to certain of the essential elements involved. All this the laymen as well as the specialist must understand and recognize if co-operative plans are to succeed. It is this phase of the problem that I shall attempt to treat, feeling that even the best of plans and the best of management will fail unless intelligently supported by the mass of farmers whom it was designed to benefit.

Object of Co-operation

While in certain manufacturing lines such as the making of butter and cheese, co-operative operations seem to be favored, as also in certain breeding operations, yet in general the commonly accepted object of co-operation among farmers is to get better prices; that is, co-operation aims at selling rather than production. And this is right, for the farmer working as an individual is a past master at production, while he is becoming less and less able to market to advantage in a system growing every day rapidly more complicated and uncertain.

For example, the very opening up of markets, the finding of new outlets, the cheapening of transportation, the determination of the kind of pack or package, are all questions that are commonly handled by the dealer and that will have to be taken over by the co-operative association. This is one of the objects of co-operation because the presumption is that the dealer has figured only upon his own interests, whereas it is the belief that attention to these matters by the producers themselves will not only add to their profits but stimulate production as well.

That is to say, the farmer, busy with production, has no means of estimating the demand for what he is producing, much less of exploiting his goods and creating new or extended demands. He cannot afford to advertise. He is powerless against competition, impotent against the evils of inadequate and uncertain transportation and "the markets" are about as much independent of his influence as is the weather, the tide, the earthquake, and other antics of nature.

For example, the principal difficulty with market milk is that the supply is extremely irregular and perishable, while the demand is fairly uniform. Even more destructive of good trade than anything else is the deplorable ignorance of the public about the real food value of milk and its actual cost as compared with other standard features of the dietary. Much progress has been made by judicious advertising, but it has been mostly done not by the producer but by manufacturers and distributors in attempting to dispose of their finished products. The role of the vitamines alone is splendid advertising material for milk, and it may as well be worked up by the producer as by the dealer if only he can and will organize to do it. Here again co-operation is an absolute condition of success.

There is nothing about co-operation that will of itself get us better results than are now being realized except as it originates and sets at work machinery to deal with the details that the farmer has neither the time nor the opportunity to get at.

To be able successfully to size up the demand for any particular goods, to advertise the products and their special brands, to create new demands, to insure adequate and prompt transportation, to harmonize production and consumption, and to steady the market in ways to avoid slumps and smashing losses, are the chief objects of co-operation.

Co-operative marketing means selling in the name of the organization, in which case the individual must expect to lose his identity as well as that of his output. Besides, he must standardize his product and keep it up to grade.

The association is no stronger than the loyalty of its members, and no man is free to come and go as he will, cutting the ground out from under the organization for his own individual and temporary advantage.

What is Involved

Like other advantages, however, those of co-operation must be bought with a price; that is, the individual cannot have the advantages of co-operation unless he will subscribe to the conditions and that is what has led to such frequent failure that many have said that farmers will not work together. Co-operation means, for example, that the individual farmer will combine with others to create a selling organization to take the place of the local dealer.

This also means many other things. It means not only that the new organization must do what the dealer has heretofore done and get into touch with the markets of the world but it means that it must have the support of all the members. It means not only that the organization must hunt markets, conduct advertising and develop trade but it means that the members will as individuals keep out of the markets. As a general proposition the seller must seek the buyer and then please him after affording such information and education as the case may call for, and this is best done co-operatively, not only on the score of expense, but upon the principle that the buyer is annoyed by the huxter. He wants to buy of as few people as possible and have it over.

With co-operative marketing the day of irresponsible dumping of stuff, good, bad, and indifferent, is over. A good many personal liberties must disappear with any plan of co-operation that will work. For example, members of the California Fruit Growers' Exchange are not allowed to handle their own cull apples, much less to sell a few bushels on the side to a fancy market. The personal liberty clause must be wiped off when co-operative plans are made, and the individual must conform to the rules of the association.

Not only that, but he must forego the old temptation of cutting out and selling privately the moment he is able to find a specially good market, then become good Indian again when it suits his convenience to avail himself of the advantages of co-operation. This playing fast and loose with co-operative organizations among farmers is what has broken most of them down. For example, we have only to revert to the early experience of co-operative creameries and cheese factories. The farmers had promised to support the factory, but the moment the local market would justify it plenty of patrons would withdraw their milk and make it up themselves regardless of contracts and obligations the association might have made, justifying themselves by the charge of "mismanagement".

This is what has led most people to believe that no farmers' co-operative plan can long hold together, and this is the reason for certain iron-clad rules for the control of individuals in every successful co-operative association. For the association as such has no existence. It exists only as the individuals who compose it will stay with the job, and see it through, not only in prosperity but in those periods of adversity that are bound to overtake associations as they overtake individuals, corporations, and every form of enterprise.

Contracts

Many co-operative enterprises among farmers take the form of contracts for a term and at a stated price or prices, and the dairy business lends itself especially well to this form of sale.

The advantages of the contract system are obvious in that the farmer knows in advance approximately the terms on which he undertakes to produce, and this is no slight advantage, for he assumes risks enough from weather and from season, from insect and from fungus, from disease and from damage. To be freed from absolute uncertainty as to what his marketable product is to be worth is an object worth considerable sacrifice to obtain.

He must, however, for this purpose standardize his product so far as possible and accept low prices for that portion which does not come up to grade. This burden has always been carried by the dealer, but the moment the producer assumes the advantages of co-operation and especially those of contract, that responsibility passes to him and his association, nor must they consider the difference between standard grades and culls as all loss, for it is not. The bane of co-operative selling is the unwillingness of the producer to submit to grading.

The farmer who produces under contract must not only appreciate the difference between standard and culls, but he must accustom himself to getting perhaps two or three different prices at the same time for different portions of the same output. No factory can place all its contracts at the same figure except in abnormal times like those that have followed the war, when the public is so crazy to buy that the seller may fix the price. But that is abnormal, and in the way of all ordinary business, contracts have to be placed to the best advantage possible. This means sometimes gain and sometimes temporary loss. The farmer who would deal co-operatively must learn to accept them both.

Pot Luck

All of which means in the language of the economist that we must pay for what we get, and that we cannot have our cake and eat it too; which being translated means that we cannot have all the advantages of co-operative

selling and still retain the advantages of individual salesmanship, using the association only when we break down as individuals.

The association once formed becomes a responsible entity with which not only the world but the members must deal if farmers are to realize the advantages of organization.

Not only that, but the organization must accept responsibility and serve the public, not simply exploit it for the temporary advantage of its members. The buying public is the customer of the producer, and as such it should be cultivated and its appetite and buying power developed.

The organizations of farmers must not repeat the error of organized labor. Our labor brethren have attempted to secure all the advantages of organization without assuming any of its obligations and responsibilities. That is why they are failing now, and, unless the policy is changed, the labor unions will dissolve from sheer inability to live a life of unadulterated selfishness. The farmers must profit by this object lesson and see to it that their organizations assume their natural obligations as well as enjoy their advantages, and that those obligations shall be met even at the expense of temporary loss.

There is no machinery, and cannot be, that will assure even a reasonable profit upon every transaction. The very heart and soul of the enterpriser is the slight element of risk involved in serving the public according to its needs and its caprices, and anybody who would avoid that risk with its element of loss as well as profit is simply not an enterpriser, and he will ultimately gamble away even his opportunity to someone who is an enterpriser because he has the fortitude to accept adversity as well as prosperity in the great game of trade.

These, it seems to me, are some of the essentials of successful co-operation among farmers:

First, organizing an association to do what the individual farmer cannot do.

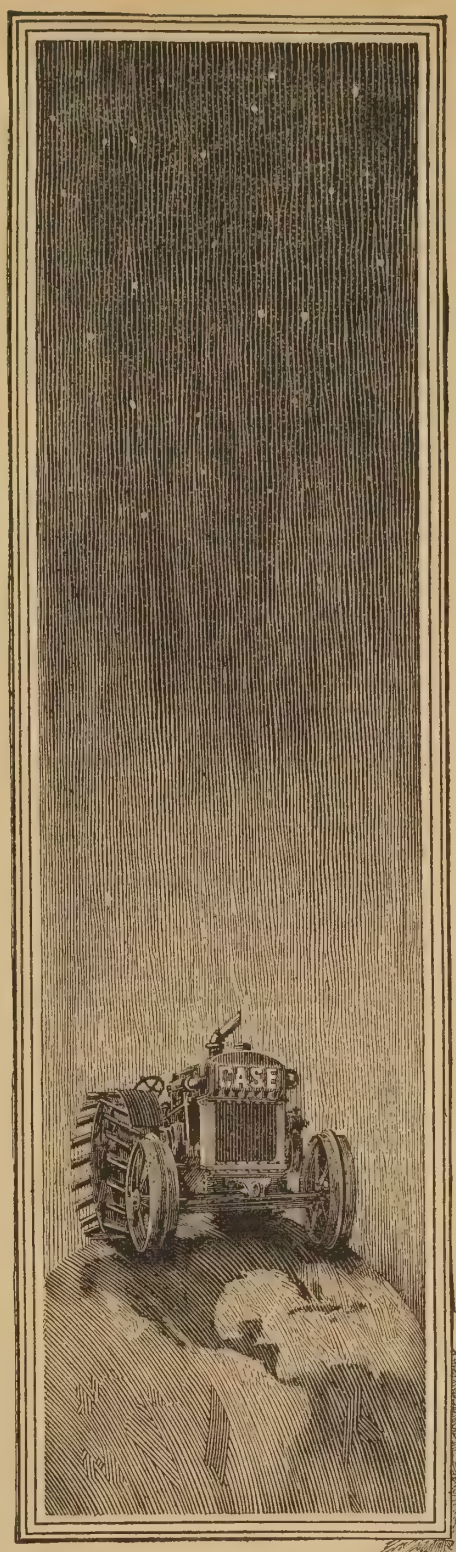
Second, selecting a manager and a board of directors that are not only capable but worthy of the confidence of the membership and the public alike.

Third, supporting the association, observing its regulations, and staying with it in adversity as well as in prosperity.

Fourth, sacrificing the right of the individual to do the best he can for himself, which will sometimes be better than any association can do for him, but presumably not in the long run.

Fifth, expecting the association to spend some money for developing trade, regarding an assured outlet with steady markets rather than "high prices" as the ultimate end in view.

These it seems to me are the essentials of successful co-operation the basis of which is faith. They could be elaborated indefinitely, but I doubt whether much would be added in the elaboration except as we should get into special problems, each of which will manifestly require its own treatment.



The Limits of Co-operation

The extent to which co-operation will be invoked for purposes of manufacture is manifestly limited. Its use for marketing is practically unlimited so far as we know, at least until the great central wholesale markets are reached.

Whether the farmer through his co-operative organization should even attempt to reach or take over the retail trade is of course a matter of great difference of opinion. The writer's judgment is wholly against the idea that agriculture should ever attempt to take over the entire business of distribution, but rather that it should stop with the enterprise of putting his goods into the world's markets to the best advantage possible where, after all, distribution actually begins.

We speak of the middle man as if the same man gathered the stuff and carried it to the ultimate consumer. Not so, one set of men gathers it together, and another deals with the distribution. It is the first that the farmer can doubtless largely take over and to the advantage of everybody.

The best educated people are those who are always learning, always absorbing knowledge from every possible source and at every opportunity. —O. S. MARSDEN.

Greetings!

"The World Over"

TO you, our legion of friends, old and new, we send our heartiest Yuletide greetings.

In the rich farm lands of the United States, in Canadian wheat fields, on the wide plains of South America and Europe—wherever Case Machinery has gone, there we count our friends.

To you who toil in these fields, year by year bringing from the soil life and strength for your nation, we owe our greatest debt. For seventy-nine years we have striven to make your task easier, your work more joyous.

In a spirit of warm friendliness and rejoicing, we wish you the age-old, "Merry Christmas".

J. I. Case Threshing Machine Company
Racine, Wis.

CASE
KEROSENE TRACTORS

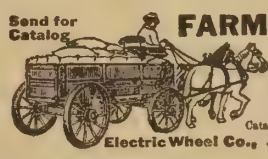
Alfalfa-Grain-Fodder Ground In A Hurry

Grind 100 Bushels Shelled Corn An Hour With Small Tractor

W-W all-purpose grinders grind anything you raise for feed. Small grains, ear corn, fodder, alfalfa, straw, etc., ground course or fine at one operation.

W-W GRINDERS

have no burrs to clog — no knives to run dull. Blunt steel hammers at high speed give whirlwind capacity. Simple, strong, durable — rocks or iron in machine won't hurt them.



Write for Full Description

Then you can see why owners are enthusiastic over remarkable capacity and all-purpose features. All sizes — one to fit your needs. Use your tractor. Investigate now. Mail card to

Wilson-Wetterhold Grinding Machine Co. Wichita, Kans

Send for Catalog

FARM WAGONS

High or low wheels—steel or wood—wide or narrow tires. Wagon parts of all kinds. Wheels to fit any running gear. Catalog illustrated in colors free.

Electric Wheel Co., 31 Elm St., Quincy, Ills.

PERFECT EAR TAG

The Tag for Dairy Cows

Because they are light in weight and neat in appearance, *Perfect Ear Tags* are the ideal identification mark for your dairy herd. They are non-corrosive and non-poisonous. Room on each tag for owner's name and address. Easily attached in single operation. For cattle, sheep and hogs.

SALT LAKE STAMP CO.
Salt Lake City, Utah

New World Champion Milk Record Completed December 18

Washington Cow Beats Average of 100 lbs. of Milk a Day for a Year

EIGHTEEN tons and a half of milk—37,454.9 lbs.—over 100 lbs. per day for a year, a new world's record milk production! Segis Pietertje Prospect, Holstein cow owned by Carnation Stock Farms, finishing her year's work December 18, is by this remarkable performance milk champion of all breeds. It took her just 318 days of her 365 to outmilk the perennial lacteal fountain of California, Tilly Alcartra. In her full year she has a margin of over 4,000 lbs. Tilly's marvelous production of 33,424.8 lbs. completed two years ago was believed so great it would stand. What must now be thought of a milk flow of 37,454.9 lbs.?

Segis Pietertje Prospect freshened December 15, 1919, and was put on test three days later. She produced 686.4 lbs. milk in seven days, making 109.6 lbs. in 24 hours less than two weeks after calving. Her largest seven-day and single month's records were made in March, when she made 858.9 lbs. of milk in a week and 3,716 lbs. within the month. One hundred and twenty days after calving she gave 808.6 lbs. milk containing 26.54 lbs. fat. Making "thirty-pound butter records" was a simple matter with her, the only requirement being the presence of a tester—she furnished the necessary milk and fat. Six months after calving she made 743.1 lbs. of milk, 24.72 lbs. fat, in a week, her high milk flow for a day being 111 lbs.

In June the champion made 3,188.7 lbs. milk; in July, 3,121.4 lbs.; and in August, 2,959.9 lbs. When September was ended and 286 days of the test were finished, she had crossed the fifteen-ton mark and tallied a total of 30,698.3 lbs. milk, 958.28 lbs. fat. November 2nd she passed Tilly Alcartra's mark and became world champion with 33,499 lbs. milk, with 47 days to go. On the night of December 14, her total production was 37,134.9 lbs. milk, 1,147.92 lbs. fat. Her caretakers estimated her production by the night of December 18, when the year's test ended, to be 37,454.9 lbs. milk, 1,156.1 lbs. fat. The exact record, with a picture of this great cow, will be published in an early issue.

One of the editors of Hoard's Dairyman saw Segis Pietertje Prospect in November and reports that she shows no ill effects from the extraordinary work she has done. As the Carnation herd averages, she is not an extra large cow, is more white than black, of quiet disposition, and "looks the part" of a champion. She is a splendid individual, possessing such type and conformation as will carry her well up in any show yard competition. She is straight, strong, and showy, and an animal of quality. Her udder is well formed and of fine texture. She appeared to be in the prime of condition and gave less evidence of being "pushed" than did many of her stable mates. She is safe in calf and due about April 1st.

Throughout the period of the test the champion was fed and milked by Carl Gockerell.

Washington, D. C., Weekly News

[Special to Hoard's Dairyman]

WASHINGTON, DEC. 13—The Calder Bill pending in the Senate is attracting considerable attention. Although it is not being seriously pressed for passage at this time there seems to be a determined effort on the part of food and drug manufacturers and associations to insist on its enactment.

This bill provides very simply that goods packed and shipped in interstate commerce in packages need only conform to the federal laws in order to be sold in any state or territory. That is, state pure food, feed, fertilizer, or insecticide statutes, if in conflict with the federal statutes, will be illegal, and non-enforcible so far as they would apply to package goods in interstate commerce.

Two illustrations are given as to effects of this law, if passed. The New York state laws and the laws of many other dairy states provide that feeding stuffs, if sold in packages of any kind, must bear on the tag, or printed label, certain facts as to the material of which the feeds are made, and the contents in terms of protein, carbohydrates, and crude fiber. This law is a great protection to the purchasers of animal feeds, but this kind of labeling is not required by the federal pure food and drug laws, or any other federal statutes; hence the enactment of the Calder bill, it is feared, would make null and void the New York and other similar state laws as to all interstate shipments of feeding stuffs.

The other illustration is in regard to laws controlling the sale of oleomargarine. For example, in Pennsylvania colored oleo may not be sold at all. The Calder bill, if enacted into law, would wipe out this and all other similar state laws as to interstate shipments of oleo. This bill is Senate Bill 3011. Dairy and food commissioners of several states are protesting very strongly against it. It has the argument in its favor that the operation of the federal statutes would be a distinct advantage to many states which do not have adequate state statutes. The reverse would probably be true in those states where more advanced statutes have been passed than Congress has as yet enacted.

Notice has been served verbally on Dr. W. C. Fowler, health officer of the District of Columbia, that legal action is to be taken against him to invalidate his ruling which shuts out milk offered for sale in Washington City by the Merrill-Soule Co., produced on New York State dairy farms from non-tuberculin tested herds. At the time of the controversy last summer when the Maryland-Virginia Producers' Association was perfecting its reorganization, and there was trouble with the Washington dealers over the establishment of fall prices, one or more dealers here made arrangements to get milk from New York State and presented applications from 182 dairymen there for licenses to produce milk for sale in Washington. These New York dairymen were selling milk to the Merrill-Soule Co. of Syracuse, it was stated, and plans had been perfected whereby that company would send the milk here. Dr. Fowler refused the licenses on the ground that the New York herds were not accredited as tuberculosis free—as are all the herds supplying milk to this city. Just what form the action will take has not been disclosed.

The schedule of tariff hearings to be given by the Ways & Means Committee of the House of Representatives, preliminary to tariff revision in the special session of Congress to be called by President Harding soon after March 4, includes three days for the entire agricultural schedules, January 21, 22, and 23. Oils are included with chemicals and paints in the opening hearings on Jan. 6, 7, and 8. So far as learned the butter schedule will be considered on Jan. 21.

The storm over relief for agriculture which nearly swept Congress off its feet during the first week of the session is subsiding somewhat. The sober second thought that the farmers have taken their loss, seventy-five per cent of the crops are already in someone else's hands, the thing that relief was intended for has happened, and whatever relief was now brought about would function for the benefit —chiefly—of some one besides the real farmers, is gradually getting hold. In the Senate the Gronna Concurrent resolution for the revival of the War Finance Corporation seems likely to pass, but there is a strong wave of opposition to it, and a still stronger one in the House. The more conservative measures looking to the extension of credit through the Land Banks or the Reserve Banks are moving slowly. A proposal to put embargoes up against imports, particularly of wool, until a tariff can be enacted, is strongly supported and may pass, but even this has strong opposition from consumers and from manufacturers. The Packer bill is under debate, and the debate bids fair to continue until the supply bills make their appearance, after which all the available time will be put on these bills. In the House a bill was passed on Monday, Dec. 13, restricting all immigration for a period of a year, a compromise between the Union Labor crowd which demanded first four-year restriction, then two-year restriction, and the non-restrictionists. This bill is likely to have "hard sledding" in the Senate where a restrictive proposal based on certain percentages of present alien population seems to be the method which has majority support. Definite announcement is made that while hearings on tax and tariff proposals will be held, no legislation on these subjects will be attempted until the special session.

Farm Bureau Business Organization

Up to date the Rock County, Wisconsin, Farm Bureau has distributed seven carloads of New York apples. These were ordered directly from a farm organization in New York, and have been retailed for the Farm Bureau members of Rock County at $1.60 per bushel. We have 5 more carloads on the road, and expect to have them distributed in a very short time.

It is against the policy of the Rock County Farm Bureau to do very much business. We believe in the policy that a farm bureau should be an educational and fostering organization. At present we are organizing the Rock County Farm Products Company, which will do business for the members in Rock County. This Farm Products Company will handle pure seed, fertilizers, etc.

R. T. GLASSCO, County Agent.

Washington County, Oregon, Holstein Meeting

The Washington County, Oregon, Holstein Breeders' Association at its annual meeting December second elected Frank W. Connell, president; J. F. Peerenboom, vice-president; and O. T. McWhorter, secretary-treasurer. S. C. Inkley, Frank Connell, C. W. Spiering, and others urged closer cooperation of not only Holstein breeders in the county, but of all pure-bred live stock breeders for the purpose of advertising and for building up and creating further interest in pure-bred stock in this locality.

One of the important steps taken by the association was the appointing of a committee to arrange for the selection of a carload or more of the best Holsteins in the county to show at the Oregon State Fair and the Pacific International Live Stock Show in 1921.

Oregon. O. T. MCWHORTER.

Ayrshires Average $485

The first Ayrshire consignment sale ever held in the South was that at Sandhill Fair, North Carolina, recently, when an average of $485 was reached. Consignments were made by Ashbrook Farm and Wendover Farm, New Jersey, and Strathglass Farm, New York. The top priced animal of the sale was Wanderer Princess of South Farm, which went to Pinehurst Farms, North Carolina, for $1,700. This farm also purchased Otterkill Isabell at $1,150. H. G. Waring of North Carolina paid $500 for White Beauty's Myrtle. The heaviest purchaser at the sale was Pinehurst Farm.

Coming Events

Jan. 4—6, 1921, Wisconsin Cheesemakers' Association meets in Milwaukee. Secretary, J. L. Sammis, Madison, Wis.

Jan. 5—Iowa Holstein Breeders' Association annual meeting, Iowa State College, Ames.

Jan. 11—Wisconsin State Horticultural Society, Madison.

Jan. 11-12—Certified Milk Producers' Association of America meets at Ansonia Hotel, New York City. Sec.-Treas., Harry B. Winters, Albany, N. Y.

Jan. 11-13—Wisconsin Dairymen's Association, Madison, Paul C. Burchard, Secretary, Fort Atkinson.

Feb. 1-4—Manitoba Dairy Association will meet at Fort Garry Hotel, Winnipeg. Secretary, L. A. Gibson, Winnipeg.

Feb. 1-10—Mid-Winter Farmers' Course, Madison.

Feb. 1-10—Wisconsin Live Stock Breeders' Association, Madison. Geo. W. Davis, Secretary, Madison.

Feb. 4 & 5—State Live Stock Judging Tournament (roundup), Madison.

Feb. 16—18, 1921—Virginia Dairy Show and Annual Convention of the State Dairymen's Association held in Roanoke. Secretary, Frank A. Buchanan, Blacksburg, Va.

The Oxen Talk in Their Stables

LUMAN W. COLTON, ILLINOIS

'T WAS in the olden time, when cows were kept in the good old fashioned way. These cows were fastened in rigid stanchions, watered once a day from an icy tank, stood in a terrible draft whenever there was a high wind, had insufficient bedding that was seldom shaken up or changed, were fed marsh hay and dirty cornstalks, milked at irregular hours, and never curried.

On that Christmas Eve, as the old custom was, they were permitted to talk for an hour before midnight. The weather had been severe, their hardships worse than common, and not much was said during the first few moments of their short yearly tongue-license. Then, amid the commonplace remarks that were being exchanged, Tiny, one of the younger cows, broke out suddenly with: "What do you suppose I dreamed last night, sisters? It was so very wonderful that I must tell you of it, although it may make you feel bad."

"Do tell us," said several of the older cows. "Life is so dull here, that anything is welcome for a change," although they were surprised to hear such a quiet cow as Tiny speak up; she was only a two-year-old, and had scarcely said a thing when they talked the previous Christmas Eve.

"I saw," continued Tiny, when thus reassured, "myself in a wonderful barn, with whitewashed walls and ceilings. I stood on some kind of soft, springy stuff that felt good to my feet, and had lots of nice, dry, chaffed straw to lie down upon. My stanchion turned some way when I turned my head to either side, and gave way enough so that I could lick that sore spot on my side. I had a manger all to myself so I did not have to eat too fast in order to get all my own feed. And such a supper! I don't know the names of the things, but there was a nice forkful of what must have been silage, with a mixed ground feed on top that had something besides corn and oats in it. And when I had this all eaten up they gave me a nice lot of wonderful rich hay. I never tasted anything like it before. It had lots of leaves on it, and smelled so nice that I could have eaten it all night. And at my side was a dish full of water warm enough to drink comfortably, that I could reach whenever I wanted a drink. A kind man came along and gave me a good combing and brushing, until I felt like a new cow. And the barn was so warm that I didn't have to stand there and shiver. Believe me, I went to bed early, it felt so good to lie on that soft bed, and then when I woke up, here I was, back in this hole," and Tiny sniffed dejectedly at her uncongenial surroundings.

The other cows coughed a bit—a bad wind came up, and they were cold. "You have had a wonderful dream, Tiny," said one, "but it sounds like a fairy tale. If we had things like you described them, we would be in paradise, but I guess we never will have. The only time we ever have any fun is when we are out on pasture. If cows had a Santa Claus I'd wish that he take me to such a home. But let's hope he gives us an extra bundle of cornstalks apiece for our Christmas dinner." And as the hour passed, and their tongues were silenced for another year, each cow, before she lay down, paused a moment on her knees, and prayed that Tiny's dream might soon come true—if not for them—then for some other more fortunate sisters.

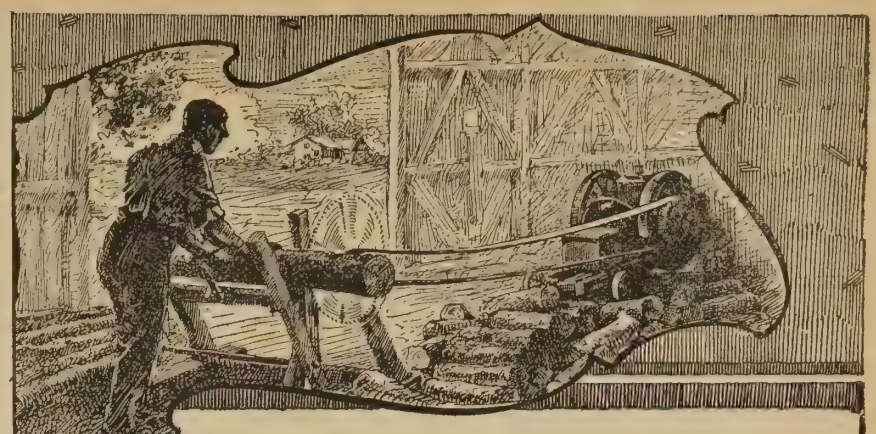
National Dairy Association Annual Meeting

The annual meeting of the National Dairy Association was held on Friday, December 3rd, at the Auditorium Hotel, Chicago. One hundred and twenty members were present in person or by proxy. The Board of Directors presented a review of the year's work with recommendations for the future, and the report of the treasurer showed a very healthy financial condition of the association.

The main subject of discussion was the building of a home for the National Dairy Industry at some central point in the country where all dairy interests would be brought together, and where shows and conventions could be held.

A committee was appointed to investigate the whole question of building, how to arrange for its construction and where to locate it. A full report will be made to the membership and to the public as soon as the committee has investigated the subject in its entirety.

The old board of directors was re-elected and a committee was appointed to develop new and important features in the show that will be of greater usefulness to the average dairyman. Another committee was appointed to bring about closer community of interest between all field forces working for dairy improvement, leading to a greater use of the annual show as a common terminal for purposes of comparing each year's progress in the dairy work of the whole country.



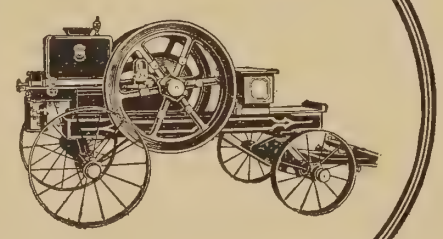
The directors' report showed a healthy increase in exhibits of all kinds and an increase in attendance at this year's show.

At the meeting of directors immediately following the annual meeting, the officers were all re-elected, as follows: H. E. Van Norman, president; Col. G. Watson French, vice-president; J. A. Walker, vice-president and treasurer; and W. E. Skinner, secretary.

First Aid in Time of Trouble

Animals get sick, and the first question is, "What can I do?" or "What is it?" To answer these questions and to give information concerning the more common live stock diseases the Wisconsin College of Agriculture has **just** issued a circular entitled, "First Aid to the Stockman". It is not technical and it is not intended to take the place of the veterinarian, but it does list some of the more common diseases, describes their symptoms, and outlines methods of prevention and treatment.

This circular will be sent free to residents of Wisconsin who apply for it. Residents of other states may secure copies by enclosing five cents with their application to the College of Agriculture, Madison, Wis.



The LAUSON

Why is it that some farmers still buy farm engines on **price** alone? Even with the most modern factory equipment and large production fixed costs enter into good engine building. And the **best** is always the **cheapest.**

The **Lauson** "Frost King" Junior could never have earned its present popularity on a price standard. Careful selection of materials and precision methods account for its reliability. The practical experience of thousands of farmers has proven its value. The growth of our business these twenty-five years has made the **Lauson** the standard of farm engine values.

It is strange if **your** dealer does not sell and recommend the **Lauson.** In any case protect yourself by asking for our free Engine catalog—a picture book of **Lauson** performance.

If you are thinking of buying a farm tractor, don't fail to ask also for the Lauson Tractor Catalog—"The Full Jewel Tractor."

The John Lauson Manufacturing Co.

EDITORIAL COMMENT

IN the plea of the United States Department of Agriculture for creameries and milk producers to put up an ice supply for next summer, this statement is made: Last year one creamery returned over $2,600 worth of milk and cream to its patrons and a milk plant received nearly 50,000 gallons of sour milk in one year. These are heavy losses which can well be attributed to carelessness or poor methods of handling milk and cream. It does not, however, tell the whole story nor measure all the losses. Whenever patrons are careless in the production of the raw material for the manufacturer of butter, cheese, or market milk, the quality of the product suffers and this leads to decreased consumption. Instead of building up a larger demand for dairy products, which is so desirable in this country, it causes an under-consumption.

There are thousands of dairymen in this country who, with little effort and care, can harvest a crop of ice—one of the real paying crops of the farm. Some dairymen have springs and arrange for cooling their milk with well water; this gives fair results. But in every instance where a farmer is so located that he can harvest a crop of ice it should be done, for it pays.

QUALITY AND CONSUMPTION

Our attention was recently called to a family buying a certain brand of butter, the quality of which was poor. Without any particular discussion it was decided that another brand should be purchased. The change was made and the result was that the consumption of butter in that family increased at least twenty-five per cent.

This incident points out clearly and forcibly that if the dairy interests wish the people to consume more dairy products and pay a price for them in keeping with their cost of production, they must produce a high quality of product. No amount of advertising and of pleading that dairy products are selling below the cost of production will cause the consumer to change his attitude or lead him to consume more unless they are of good quality. The man who milks the cows and prepares the milk and cream for market is the one who has the largest control over the quality of our dairy products.

NEW FERTILIZER DISCOVERY

We are sure our readers will be interested in learning of a new discovery which may revolutionize the fertilizer industry. The Weekly News Letter of the United States Department of Agriculture reports that the Bureau of Soils has discovered a process of extracting phosphoric acid from phosphate rock by heating mixtures of this mineral, sand, and coke to a smelting temperature in a fuel-fed furnace.

The old process of making phosphoric acid in phosphate rock available immediately as plant food was to mix an equal quantity of sulphuric acid with phosphate rock, the resulting product containing only one-half the percentage contained in the rock from which it was derived Through the heating process, it is possible to produce a commercial fertilizer which will contain 50% soluble phosphoric acid. Raw rock phosphate contains about 32%, and if this rock is treated wth sulphuric acid it will contain only 16% acid phosphate. When the acid phosphate is extracted by heating, ammonia gas is mixed with it and the result is a solid product known as ammonia phosphate.

At least, two large savings are made. In making phosphoric acid available by the use of sulphuric acid, a loss of two-thirds of the rock is sustained. This is an immense waste of phosphate eliminated by the new process. The second great economy is a saving in freight and this is no small item. The Bureau of Soils reports that this product is similar in properties to the ordinary 16% acid phosphate, is convenient to handle, and may be used by any intelligent farmer who has technical knowledge of reducing the quantity placed upon the soil to guard against direct contact with seed. It is to be hoped that in the near future this product will be manufactured on a large commercial scale, for it will be the means of furnishing phosphoric acid to the farmers at less cost.

HOLIDAY REFLECTIONS

The advent of Christmas and the holiday season should cause all of us to lay aside our material anxiety and consider how much our friends and families contribute to our happiness. The seeking of wealth, power, and distinction never has or never will bring enjoyment or contentment as will wholesome friends and family associations. The world is in a turmoil. It is full of discontent and sorrow. We have famine in the Far East; in the war stricken countries a struggle for peace and necessities of life; and in America an adjustment of economic conditions. Each section believes it has the most serious problems to solve and the hardest row to hoe.

In our own great land our troubles are largely of our own making, for our desires for gain, for luxuries, and for everything that humanity craves have led us beyond our earning powers and our credit has been extended to the limit. While all this has brought about a strained condition; has created a serious economic crisis; has caused strong men to wonder what the final outcome will be, yet we have within our reach an adequate supply of food and clothing and, above all, friends and our families. We should not be too much disturbed over the adjustment of material wealth when the fundamental things in life's happiness have not been destroyed. Greed and selfishness of men are at the bottom of most of our troubles. Our times have given opportunity for men to exercise their powers for selfish gain. We have all tried to get too much and now we are face to face with the adjuster, the accountant of all ages.

We must appeal to our best side at this Yuletide season and bring ourselves in an attitude of mind that our plight may be corrected without the sacrifice of homes or the dissolution of our friendships. The opportunity is ours for serving one another, of giving to those less fortunate than ourselves. Herein lies the opportunity of true happiness and a noble life. Let us pause for the moment, as the angel of good tidings hovers over our land, and recount our blessings and extend to our friends, neighbors, and all mankind a Merry Christmas and a Happy New Year.

PRICES AND THE DAIRY SITUATION

It is well to consider now and then the factors which influence the prices of dairy products and dairy cattle. For the past five or more years the milk producers of this country have formed organizations for the purpose of securing better prices for milk. The work of these associations has been of material benefit to their members and they filled a large and important place in the development of our dairy industry. The undue emphasis put upon prices has, we fear, led too many dairymen to lose sight of other important factors.

The coming of the great world war brought about unstable conditions and disrupted business relationships. The prices of many commodities advanced unusually fast while others remained almost stationary. Dairy products did not advance in price as rapidly as did the cost of producing them. This caused discontent and led producers to protest and to organize in order to secure proper remuneration for their products. This condition led many farmers to consider that the price for which their products sold was the largest and most important factor in giving them proper returns. While the prices for dairy products must never be lost sight of, yet when men place their whole attention upon securing better prices, they ignore factors far more important in controlling prices than any effort that can be put forth to get proper returns for dairy products. When dairy products become too high in price there is a decreased consumption and so-called substitutes find a much larger market.

In the years 1913, 1914, 1915, and 1916 oleomargarine replaced whole milk to the extent of about two and one-half billion pounds and in 1919 to the extent of six billion pounds. It is not to the advantage of the dairy industry to have conditions that lead consumers to use so-called substitutes, but this is the outcome whenever prices of dairy products get beyond what they consider more than they can afford to pay. One of the deep regrets of the present dairy situation is that the farmers themselves reasoned, as did many other consumers, that dairy products were too high in price and so used oleomargarine. We do not believe the prices for milk, butter, and cheese were more than they should have been to make adequate returns to the producers, considering cost of production, and character of cows kept, but nevertheless the prices became so high that so-called butter substitutes and milk substitutes found a larger demand. Producers should know these facts for they are important, especially to those engaged in carrying on the work of milk producers' associations.

There is no real surplus of milk, butter, and cheese. On October 4th it was reported that we had on hand 250,000,000 lbs. of condensed milk, about one-twentieth of our annual production of condensed milk or less than one-fourth of one per cent of our total milk production. This small surplus has been a tremendous factor in depressing the prices of market milk and we believe too much emphasis has been put upon it. It has been calculated by Professor K. L. Hatch of the Wisconsin College of Agriculture that if every man, woman, and child in the United States would double their consumption of milk this surplus would be absorbed in a single day. It has been pointed out by scientists, not directly interested in the dairy industry, that the population of the United States does not consume one-half as many dairy products as it should. In surveys that have been made by dairy councils, it has been found that the children of the farm are consuming less milk than the children of the cities. It is our opinion that if the children of the farm would drink more milk and the farmers quit purchasing oleomargarine there would immediately be created a demand beyond the present potential supply of milk. Here, then, the farmers have within their own power the opportunity of doing away with one of the most important factors in depressing the prices of their dairy products, namely, so-called surplus.

In considering the factors influencing prices, we must not overlook the low producing cow which so many dairymen are satisfied to keep. The poor cow is not only unprofitable to her owner, but the milk that she produces tends to create a so-called surplus and it is a material force in depressing the prices of all dairy products. The man who keeps unprofitable cows is doing more to depress the prices of dairy products than all the other forces combined. There is only one suggestion that can be made to such a man and that is: cull out the unprofitable cows. It should be stated that with the present prices of feed and of milk and its products the dairy farmer can make more money this winter feeding good cows than he did last. It should also be borne in mind that all industries are suffering and are being forced to adjust their business to a different basis because of the decline in the prices of their commodities.

The effort to secure high prices for dairy products has caused the dairy farmer to neglect the quality of his product. When butter, cheese, and milk are of good quality the consumers naturally eat more and when poor, less. The dairy farmer

should also show the consuming public that he believes in his own industry and this means that he must stop consuming so-called substitutes and use more milk and milk products. All of these factors the dairy farmer can control. It is only good business to pay larger attention to them and not go price mad. In other words, the dairy farmer should consume more of his own product, eliminate the poor cows and breed better ones, produce on the average a higher quality of milk and cream, and give the closest attention to raising crops suitable for making good rations.

Further, he should not hesitate to contribute his share towards advertising the food value of milk and its products. Consumers will not pay what dairy products are worth until they appreciate their importance and food value.

The Tuberculin Test

HOARD'S DAIRYMAN:—I have been reading with much interest the reports of your herd with regard to the tuberculin test. My herd seems to be in the same position as my foundation cows were all healthy nine years ago, and I have never allowed a cow from outside on the farm during this time. Two years ago I decided to place my herd under federal and state supervision and had my first test a year ago. This test revealed one reactor, a fresh heifer 2 years old, and upon post mortem examination they found two calcified lesions about the size of a pea, one occurring in one of the lymphatic glands and the other on the edge and under the flesh of the liver. At this test we had six go suspicious, which were tested in 120 days with a double dose and all were clean. These tests were all subcutaneous.

This fall I had another test, with the intradermal and ophthalmic as a check. Do you like this test, and how do you read it? Would you call a slight lacramation in the eye suspicious or would you call it a reactor? Then again with the swellings; we had a number that we could not agree on, several as large as a kernel of wheat and two a size larger, all with typical incrustations. We also had some cows with no swellings.

Now I feel this way about it, all swellings are reactors in the intradermal if they are hard, typical swellings, no matter what their size, but I feel that the lacramation is not sufficient to condemn an animal.

Do you think there is any danger of giving the cows a tolerance by using so much tuberculin?

Michigan. E. C. R.

We believe that this method of procedure in the use of the three tests is excellent. The authorities agree that this combination of tests is more searching and will eliminate more tubercular animals from the herd than any one given test.

The view regarding the interpretation of the intradermic test seems to be in line with that held by authorities on the interpretation of the test—that is, that any swelling the size of a pea or larger should be considered a reaction. As to the interpretation of the ophthalmic test in herds in which a large percentage of reactors are revealed a profuse and continuous lachrymation should be regarded as very suspicious. In fact it might serve the herd owners' interest best by considering such an animal a reactor. However, in a herd with reliable "good history" we would not consider a lachrymation as suspicious unless the animal was suspicious to one of the other tests in combination, then we would consider her a reactor.

As to producing a tolerance in the cattle by the administration of the amount of the tuberculin used in applying one combination test, we do not think that this would obtain if the animals were not tested more often than every six months. Of course, we are aware that we must take cognizance of the question of tolerance in dealing with tuberculin in our herds and we are also aware that reactors may not react on a subcutaneous test sixty or ninety days or even six months afterwards and still show visible lesions of tuberculosis on post mortem, but as to whether this phenomena is due to tolerance or some other agency we do not know.

Farmers Should Use More of Their Own Products

HOARD'S DAIRYMAN:—All over the country we hear the cry that there is an overproduction of milk and that buyers are refusing to buy at any price. If this is true, and it looks as though it is, what is the reason?

We have tried to produce all we could but we have done it thoughtlessly; we have put it on the market without paying any attention to marketing and advertising. We have allowed our dairy products to find their own market while the so-called substitutes have been advertised everywhere.

But, who are using these substitutes? Is it just our city friends? No! Farmers and dairymen are supporting an industry that is undermining their own. Think of it, a farmer, milking cows twice a day, year in and year out, going to meetings in the attempt to get more for his products, yet he does not eat his own best product! Any man that is interested in dairy cattle and uses a substitute is getting too much for his milk if it is only a dollar per hundred. He is a detriment to the dairy business and his fellow dairymen should shame him when they see him buying the substitutes.

If he were only talked to, the average farmer would take the penny away from his eye so he would see for himself that there is a dollar in sight. Every cow milker should get acquainted with his national and state dairy council organizations that are trying to advertise the dairy products and get people to use more of them. He should donate a certain per cent of his sales to these organizations.

The merchants of Darien say that the sales of oleo have been cut half since the cow testing association started an "Eat More Dairy Products" campaign, but they say that one-third of the oleo they sell still goes to farmers. They say they get 2 cents for selling butter and 5 to 7 cents for selling oleo, but even at that they would be willing to stop selling it for they realize how dependent they are on the prosperity of the dairy farmer. They will stop sales when the farmers don't demand the substitute. If we will all put our heads together, instead of an oversupply of milk we will be wondering where we can get milk enough to go around.

Now is the time for farmers to cut the cost of production by culling the boarder cows and feeding the good ones better, raising the good calves and raising them better and knowing how to feed right for economical production.

Wisconsin. GEO. L. MOSS.

Fat in Buttermilk

What is the standard per cent of fat that the buttermilk must have? I find sometimes in my buttermilk as much as two per cent.

Lima, Peru. H. M.

In a properly operated creamery where special care is taken in churning, the buttermilk will seldom exceed 0.2% in butterfat and it frequently drops below 0.1%. In plants which ignore the importance of the exhaustiveness of churning and which do not systematically check it up by testing the buttermilk, it is not uncommon to find the test amounting to from 0.5% to 1% or more.

As it is difficult to correctly determine the per cent of fat in buttermilk by the ordinary Babcock test, the results of the test frequently do not show all the fat present in the buttermilk. In testing buttermilk it is well to use the skimmilk test bottle having the specially constructed double neck. It is especially necessary to see that buttermilk is stirred thoroughly before sampling, as the curd settles to the bottom very rapidly and it is the curd that holds the bulk of the fat contained in the buttermilk.

Crops for Peat Soil

I have 80 acres of peat land. Kindly inform me what crop can be grown on peat soil.

Minneapolis, Minn. A. K.

Peat land varies so much in composition that it is rather difficult to state just what crops may be best adapted to it. In some cases it is very difficult to bring under cultivation and, in others, it is susceptible to drainage and proper fertilization so that it will produce wonderful crops.

Peat lands that are shallow, well decomposed, and underlaid by clay or silty clay, are the most desirable types to reclaim. Those that are coarse and deep and underlaid by coarse sand are the least desirable. Where there is extensive moisture, the land must be drained and if there is a considerable growth of grass and brush this must be removed. The soil is quite likely to be deficient in potash and, if so, needs an application of this in order to produce good corn. There is also the possibility that phosphorus may be needed for the best results.

Almost any crops are suitable to these types of land but they have been most generally considered desirable for trucking purposes or for the growth of other intensive crops. However, corn on a peat soil that is properly fertilized makes most excellent growth and is quite superior to the usual up-land soil.

Home Grown Dairy Rations

HOARD'S DAIRYMAN:—The average dairy farmer tries to raise as many of his necessary feeds at home as possible. In the great dairy regions of this country he has most easily available the following: clover or alfalfa hay, corn silage, and the cereal grains.

In order to determine whether these materials are adequate to feed the high producing dairy cow, Professors Hart and Humphrey of the Wisconsin College of Agriculture have conducted two sets of experiments, the complete data of which has just been published in the Journal of Biological Chemistry.

The first experiment dealt with a mixture of clover hay, corn silage, and the cereal grains. It was found that no combination of these materials would keep up the milk flow of the heavy milking cow, and that she produced her milk at a considerable loss of body protein tissues. The moderate milking cow, that gave only 20 to 25 lbs. of milk a day, by being given a large feed allowance, was able to get along very nicely.

The second experiment was conducted in the same manner, but alfalfa was substituted for red clover. The grains used were corn, barley, oats, or a mixture of the three. The alfalfa used was not especially selected, but was a commercial product grown in the West. The alfalfa hay was cut in a feed cutter, and the grains were ground. The animals were fed all they would consume.

A nutritive ratio of 1:7:9 was made possible with the materials used. There seemed to be no difference in the efficiency of the ration whether the grains used were corn, oats, barley, or a mixture of the three.

Contrary to the results of the red clover experiment, the cows given alfalfa hay maintained their milk flow at a maximum point, and did not draw upon the nitrogen tissues of the body.

For a period of four months, therefore—the length of these experiments—it seems certain that a home grown ration of alfalfa hay, corn silage, and the common farm cereals will maintain a high flow of milk without injury to the cow.

The grain was fed, on an average, in the proportion of one pound to every three pounds of milk, a practical rule much in force.

Wisconsin. W. A. FREEHOF.

Cleaning Test Bottles

HOARD'S DAIRYMAN:—We have read with interest the articles you have recently published on the above subject. Not until the middle of the fourth year of testing work did we have a sign of the brown coating on our bottles—though our system of cleaning them was identically the same. It puzzled us to know the underlying cause. We finally found an expert who told us it was caused by an excess of iron contained in some batches of sulphuric acid. We tried to remove it—first with muriatic acid, concentrated lye, etc., none of which would budge it. The B. B. shot remedy will remove it, but if one cares to save time take equal parts of concentrated sulphuric acid and potassium bi-chromate. Fifteen bottles can be cleaned as quickly as one can be cleaned with shot. We prefer to empty the bottles on some undesirable vegetation that is found in or near most all yards—except in winter, it is thrown on an old trash pile or the snow. A well made quart cup with a lip is used for mixing the samples—also filling and washing the bottles in place of a tin can used by some.

Wisconsin. F. L.

Twin Calves

In the case of twin calves is a bull born twin with a heifer sterile, or is he as sure a breeder as bulls of a single birth?

Modesto, Calif. G. M.

It is very unusual that a heifer twinned with a bull will breed. Twins, where both are female, will breed and twin bulls will breed; also, a male twinned with a heifer calf will breed. It is so unusual that a heifer twinned with a bull will breed that we consider it unwise to raise such an animal for the small chance that she will reproduce.

Dairymen's League Elects Officers

H. H. LYON, NEW YORK

THE annual stockholders' meeting of the Dairymen's League was held this year in Utica, N. Y. It was explained that this was a special informal meeting, since the regular official meeting must be held at the office in Jersey City, N. J. At the hour of opening there was a crowded house, every seat appeared to be occupied in the very large armory used for the meeting. It seems that three per cent of the membership must be represented to constitute a legal meeting. It was found that far in excess of this number were regularly represented.

President Cooper, in his address, noted the unsettled economic conditions of the country but he believes that we are coming to a better condition for agriculture. He mentioned that the Dairymen's League appears to be the largest and strongest dairy organization in the country, and that its action is being closely watched by those in other organizations. He reviewed the difficulties that have been encountered practically every month since the first of April in trying to negotiate sales. Then he came to the point where the serious difficulties of October first commenced when some twenty-five per cent of our members were deprived of a market. The remarkable stand made by those left out was strongly complimented and this compliment received the most hearty applause. He went further and urged that those few who have been compelled to surrender and sell independently should not be considered traitorous. They are temporarily surrendered to the enemy but they will soon be fighting with us again.

Manufacturers of dairy products have been obliged to sell products at a loss. The League plants have also sold at some loss where they have been obliged to manufacture. The average loss or return below League prices has amounted to practically fifty cents a hundred for the milk so manufactured. Just as soon as we can get the pooling plan in operation it will be possible to avoid such losses. It is admitted that markets are now demoralized. The time is ripe for us to strengthen our organization and give it power to help clear up the situation. Advertising has been neglected because there were no funds with which to pay the bills. Give us the pooling project in working order and we can draw for funds in proportion to the service they are to receive. Out of the present situation there will dawn a new day for the American farmer.

Secretary Manning announced that there are 1,120 branches now operating, 89,496 members now on the books, and that these men own 946,651 cows. There are doubtless some who have dropped out of business but no one knows how many. It is estimated that this may be ten to fifteen per cent. The price of milk for 1920 has averaged about $3.28 per hundred, or forty cents under the cost of production as estimated by the Warren formula. The price, however, is much in advance of that obtained in unorganized territory. The use of milk in the city has been increased by about nine thousand cans. In relation to the pooling, it is found that dealers' propaganda has had some influence with business men, banks, etc., and there has been influence from such sometimes detrimental to the success of pooling.

When it came to the treasurer's report it was found that over $408,100 has been expended, or more than $11,000 in excess of receipts. There are certain advertising contracts that will reduce or wipe out this difference. There is a balance on hand November 30th of $162,756.81.

Coming to the announcement of the election of delegates from the various districts much interest manifests itself. It was expected that there would be conflicting interests and reports. Some three or four districts delayed but not long.

Director N. F. Webb of Cortland spoke of the G. L. F. Exchange. Seven hundred thousand dollars of the million wanted as capital has been secured and more is coming. Already a million and a quarter pounds of timothy is ordered. At the feed end, 300 cars of feed has been sold. A feed man of twenty years' experience in a big wholesale business is in charge. Dairymen ought to support this agency for the sake of retaining it in efficiency as well as to save themselves on the costs of feeds purchased.

Two addresses at the convention stand out prominently. One was by vice-president J. D. Miller and the other by W. J. Kittle of Chicago. Mr. Miller is a gray-haired gentleman, somewhat under size, speaks deliberately but with force. He could be heard to the furtherest end of the hall, and he is called the "youngest man" of them all. He carried the convention almost to a man, receiving the applause even of those who do not fully approve of the form of pooling plan. His plea was for the acceptance of the contract as it now stands, and he proved his point if any speaker does that. It was freely predicted that pooling will now come through with a rush. Delegates were enthused.

Vice-president Miller went over the whole situation as though he were summing up a case before a jury. Indeed he may have been doing just that, and his jury was composed of two thousand farmers. Of McCann, he said here had been employed a man with a trenchant pen with long years of experience in "misunderstanding facts". Soon he came to the pooling contract. He did not deny that it has "teeth" in it. It must be strong to protect the faithful against the unreliable and the vacillating. Article 10 is often the stumbling block. Mr. Miller could not see how ten cents can be called for, but in some emergency there may be in some month even more than that needed. It would be unwise to limit it for then the enemy would know just where to strike and how to proceed in order to embarrass the most. Directors have been elected today, men known by the men who selected them in each district, and in whom "you have confidence". "Now don't put them in a straight-jacket". "This cause is worth fighting for and worth praying for." "It means the future of the farm industry in the United States."

The resolutions committee did a big stroke of business, and every one of the resolutions offered had something alive in it. They favored a tariff on dairy products to cover differences in labor. They approved the support of the G. L. F. Exchange. They wanted an advertising campaign for milk and dairy products. More stringent laws are needed on oleo and the substitutes for milk. Uniform inspection is desired and that by the state health department. They would

bond all buyers of milk for the protection of the dairyman. The pooling contract was endorsed and a half dozen reasons for it strongly and concisely stated. No change is wanted in article ten. Most of all, the convention accepted all this without a dissenting voice. Dissenters were there but in such small numbers that to protest would have been unwise. There was enough of the uncertain all through the day to cause intense interest, but not a thing appeared to mar the smoothness of the convention.

Eighteen of the 24 members of board of directors were re-elected. This action as well as the other business transacted will have to be confirmed by the legal meeting in Jersey City on December 14. After this formality is completed the board will proceed to organize and elect officers. The directors for the ensuing year are: Harry Culver, Amenia; John S. Petteys. Greenwich; Harry Bull, Campbell Hall; Chester Young, Napanoch; B. M. Kilpatric, Roxbury, J. D. Beardsly, New Berlin; R. D. Cooper, Little Falls; Kenneth Fee, Mooers; A. F. Spooner, Richville; L. H. Putnam, Black River; F. H. Sexauer, Auburn; Bradley Fuller, Utica; D. F. Putnam, Cazenovia; H. J. Kershaw, Sherburne; N. F. Webb, Cortland; Paul Smith, Newark Valley; W. U. Rixford, Wellsville; W. G. Dodds, Canandaigua; Geo. S. Pickens, Cattaraugus; J. D. Miller, Susquehanna, Pa.; J. D. Campbell, Wellsboro, Pa.; Geo. W. Slocum, Milton, Pa.; and L. M. Hardin, Sussex, N. J. Messrs. Young, Fee, Fuller, Putnam, Dodds, and Milks are the new members of the board, the others being re-elected.

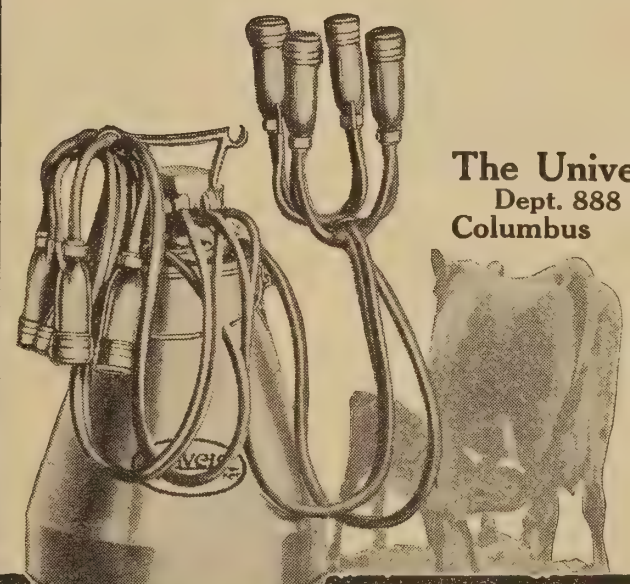
The Ayrshire—Type, Health, Persistent Production

(Continued from page 994)

able if it were more highly colored. The milk is well suited to cheese making for which it is much used in Scotland. In Canada, the breed is very popular in cheese districts. It is claimed that Ayrshire milk is especially valuable for infant feeding. It is noteworthy also that a large number of certified milk plants use the Ayrshire.

In quantity of milk production, the Ayrshire has not excelled the Holstein, effort being made to secure a liberal flow of average test milk. In total fat produced, the Ayrshire averages about the same as the other breeds. While some creditable records have been made, the Ayrshire has not been a leader in phenomenal productions. There is no doubt but that the cow has the ability—if she is put under the conditions which have surrounded the record makers in other breeds.

Garclaugh May Mischief, owned by Penshurst Farm, holds the breed's highest milk record with a production of 25,329 lbs. milk, 894.91 lbs. fat. The largest fat record is that of 955.56 lbs. fat in 22,596 lbs. milk, made by Lily of Willowmoor. The ten leading records in the mature class average 21,741 lbs. milk, 851.69 lbs. fat. The production of the average cow on test is indicated in figures from 118 records completed late in 1920. These average 10,779 lbs. milk, 432.01 lbs. fat. Those on mature cows average 11,897 lbs. milk, 472.72 lbs. fat. In the Roll of Honor division, the 300-day records completed average 9,964 lbs. milk, 404.92 lbs. fat.



The office of the Ayrshire Breeders' Association is at Brandon, Vermont. The secretary is J. G. Watson.

"Dandelion Butter Color" Is Big Prize Winner

Be sure and use Dandelion Brand Butter Color and give your butter that June golden shade which brings top prices —pleasing the eye and tempting the palate.

The High Scores of 1920

In many of the State Buttermakers' Shows, first awards were won by users of old reliable "Dandelion Brand." You can't miss by giving a trial to the butter color which helps 90% of the successful buttermakers of America.

Never gets rancid. Doesn't affect flavor.
Doesn't color the buttermilk. Leaves no sediment.
Colors more butter to the gallon.

Dandelion Brand Butter Color is purely vegetable and fully meets requirements of all Food laws—State and National. Ask your jobber for prices.

WELLS & RICHARDSON CO., Inc. BURLINGTON, VERMONT

Her Christmas Wreath

THE cups are won, the ribbons here
To prove she did her clever part.
And, if I hold her portrait dear
It proves I have a loyal heart.
Dumb animal, you say, and smile,
Tho' I have known some humans, who
Gave less in service, less in all;
The rugged virtues, large and small
Were far less lovable and true.

I hang a wreath with loving care
Around the picture of "Brown Bess",
And, as Kris Kringle scents the air,
My thoughts are most of her, I guess.
A noble friend, devoted, true,
Blue ribbon winner of them all,
I voice her charms, her pedigree,
The gifts of prizes brought to me,
Queen of a humble dairy stall.

The cider sparkles in the glass,
The tree is glimmering with light.
I see the joyous children pass,
And all the universe is bright.
But there's a wreath for one who brought
Part of this Christmas happiness.
A tribute paid — a thought for her
That makes the sluggard pulses stir —
My thoughts are most of her, I guess!

—W. LIVINGSTON LARNED.

Christmas on the Dairy Farm

(Continued from page 992)

abetting the children of our dairy farms in observing Christmas to the limit, for such good times will keep them on the farm just so much longer, and, in spite of our dairy troubles which have a way of eternally bobbing up, the cow is going to remain on her job for a while longer and produce the liquid which assures new sleds and skates and dolls and toys on Christmas morning.

And when we get too troubled or discouraged, we can think that the gentle animal with which we earn our living was present two thousand years ago at the most wonderful happening of the age, and today she bids fair to keep her place in the hearts of all men two thousand years hence—because there has never been a substitute, and never will be, invented for her.

So while the children are hiding mysterious bundles and stringing the corn and winding the wreathes and peering hopefully up first one chimney and then another in an agony of fear that they may hang their stockings at the wrong one, the dairyman and his wife, too, are pausing a moment in their busy whirl to keep faith with Father Christmas. And if they send a grateful thought out to the warm barns where the herd stands, who can blame them, for, although it is not written, I imagine that Joseph and Mary depended also on those gentle kine who kept them silent company that Christmas night long, long ago.

Air Castles on the Farm

(Continued from page 999)

This calf club is another of our air castles. It came about in this way:

As we worked it first with our pure-breds, we missed being in a dairy community and more particularly a Guernsey community. We dreamed of the advantages to be gained by being part of a center famed for its Guernseys. We lived in Boone County. How could old Boone be made a Guernsey center? Could such a thing be possible? Outside of a few neighbors who were convinced of the value of the Guernsey by frequent contact with our herd there was no burning interest in them. There was not another Guernsey in the county nor in adjoining counties to my knowledge. You know it is said you cannot teach an old dog new tricks. Then how could Boone County be a Guernsey center when the men in it fed steers or at best permitted the women to milk a few Shorthorns or Jerseys to obtain pin money.

"Begin on the child," came the answer and then we remembered the calf club idea. Boys' and girls' clubs had worked out successfully in other lines, why not in this? So we called C. R. George, the dairy extension leader, from Purdue and with him went over the possibilities; conferred with Chas. L. Hill as to obtaining calves and went to Jas. Staley, president of the Farmers' State Bank of Lebanon, who then promised to finance the club and is still cheerfully boosting for it. This project was started about three years ago. Now there are at least 250 pure-bred Guernseys in our county inoculating some 60 families to their value, besides about thirty pure-breds that have been put out in clubs in adjoining counties. It takes time to organize and encourage a calf club and many discouragements come and exacting situations have to be met.

In our experience in Boone County it has taken hard work and the pulling together of the club youngsters and their parents to make a go of the thing. When one member of a family is away doing work for the club it adds to the work of the ones at home and so we all take a just pride in our achievement. These minor air castles that have so well succeeded, namely, the proving of the value of Guernsey products and the demonstration of the value of the Guernsey herself, have helped us on the road to the land of our dreams. Is it any wonder we are loyal dairymen and that we love our gentle, unpretentious Guernsey friends?

Value of Pure-bred Sires

HOARD'S DAIRYMAN:—The year's work, recently completed, of the Lake County (Illinois) cow testing association No. 5 has shown some interesting results in regard to the comparative value of pure-bred and grade sires. Pure-bred bulls have been used in six of the association herds for a period of five years or longer. Ten of the herds have been using grade sires up until the last year. These ten herds, however, carry a few pure-bred cows which naturally increase somewhat the figures which are given below. The average milk and fat production, together with the average profit over cost of feed from each animal in the two groups of herds have been as follows:

Pure-bred sires: milk, 7,772 lbs.; fat, 272.89 lbs.; profit, $94.99. Grade sires: milk, 6,167 lbs.; fat, 239.93 lbs.; profit, $79.12.

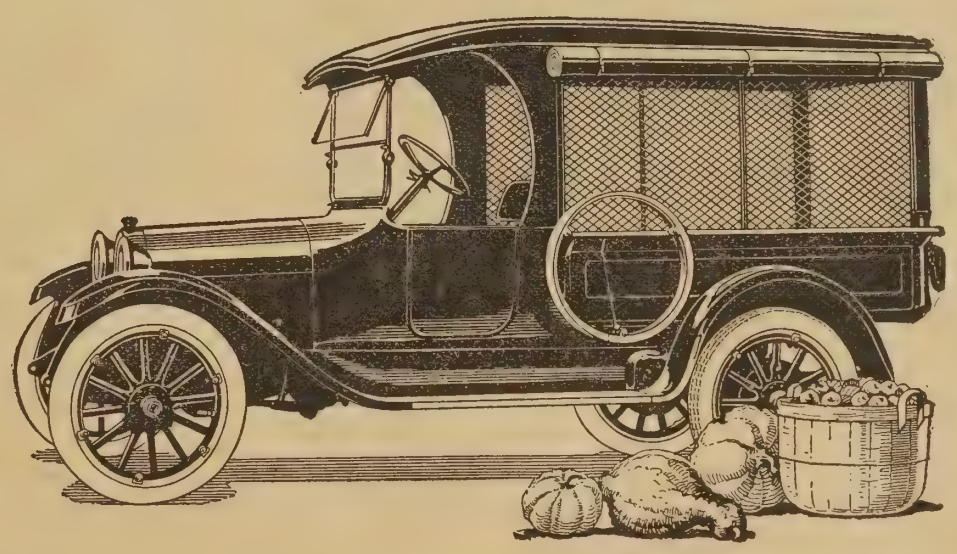
These figures show a gain for pure-bred sires over grade sires of: Milk, 1,605 lbs.; fat, 32.96 lbs.; and profit, $15.87.

Counting 20 cows to a herd this would indicate a total profit over cost of feed of $317.40 a year. Figuring the cost of a pure-bred sire at $200 the profit amounts to 158.7 per cent. One would look a long way to find the most gilt edge of securities capable of making a return that would approach this figure.

Illinois. ORIN CROOKER.

Birds as friends of agriculture are entitled to consideration from the farmers. When the snows come the birds find it difficult to make a living. Crumbs and suet placed outdoors may save bird lives.

DODGE BROTHERS
BUSINESS CAR



The fine reputation of Dodge Brothers Business Car for efficient and economical farm service is gratifying indeed.

It rests in the first place, of course, on Dodge Brothers' reputation as exceedingly close, careful and conscientious manufacturers.

Their wonderful plants at Detroit are models of scientific system, and scrupulous precision in shop practice. The result is a motor car which is a good, lasting and profitable investment.

The haulage cost is unusually low

DODGE BROTHERS, DETROIT

ALFALFA HAY
FOR DAIRY COWS
The H. M. Goldwood Co.
St. Joseph, Mo.

Alfalfa Hay
The Choice Dairy Kind
We are now moving this Choice variety direct from the fields to the consumer—weights and quality guaranteed. We handle Alfalfa Meal and other Dairy Feeds. Write or wire us for prices.
W. A. Ferson Hay Company, Kansas City, Mo.

Learn Auctioneering
at World's Original and Greatest School and become independent with no capital invested. Every branch of the business taught. Write today for free catalog. Jones Nat'l School of Auctioneering, 38 N. Sacramento Blvd., Chicago, Ill. Carey M. Jones, Pres.

DALY FOOD STOCK FEED MOLASSES
$10.50 FOR 50 GALS
Best and Greatest Stock Feed ever discovered. Equal to corn and cheaper. Barrels weigh 625 pounds, over 50 gallons. Big feeders using 60-barrel car lots cheaper. Can be mixed with roughage to replace grains. Will ship sight draft to bill of lading payable on arrival at your station. Sample and book free.
THE J. J. GARVEY CO., Dept.H.D., New Orleans, La.

SAW YOUR WOOD

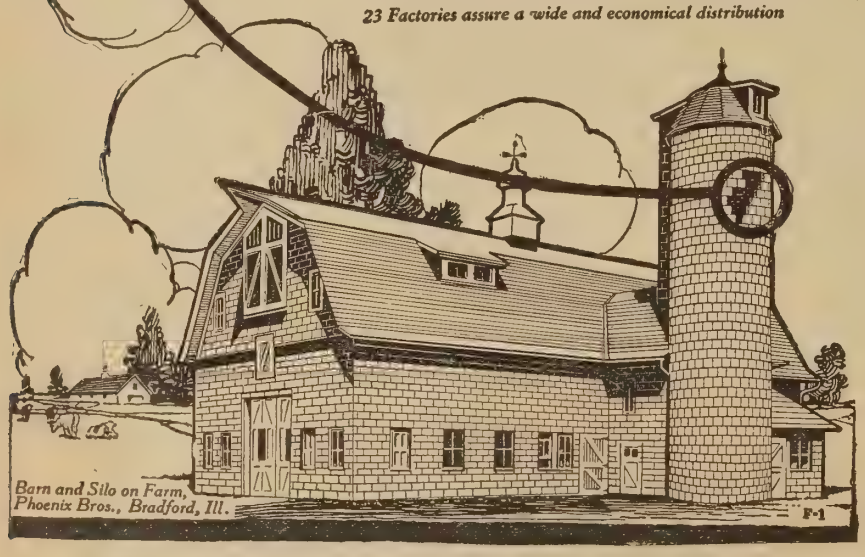
With a FOLDING SAWING MACHINE, 9 CORDS by ONE MAN in 10 hours. Send for Free catalog No. E125 showing low price and latest improvements. First order secures agency.
Folding Sawing Mach. Co., 161 W. Harrison St., Chicago, Ill.

BABY CHICKS 12½c each, postage or express paid by us. Place order now for delivery any date you desire during 1921. Safe delivery guaranteed anywhere in U. S. Highest quality. All varieties. Address all mail to main office, NATIONAL CHICK CO., 555 Railway Exchange Bldg., KANSAS CITY, MO.

Section of Natco Silo wall showing still air spaces and steel reinforcing

Keeping Silage

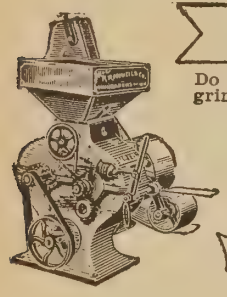
THE perfect silo must be absolutely air-tight, since air causes silage to mold and rot. The glazed tile walls and tight-fitting cypress doors of Natco Silos seal the silage like fruit in glass jars. It comes out sweet and succulent to the last forkful.



Natco Silos

are strongly reinforced with high grade steel bands, doubled in the bottom courses where the pressure is greatest. The double-shell tile also increases the wall strength and provides for secure mortar joints. The still air spaces conserve the natural heat of the silage—resist frost. Heavy galvanizing protects all exposed ironwork.

Ask your building supply dealer for prices on Natco Silos. Write for FREE book, "Natco on the Farm."



National Fire Proofing Company
1047 Fulton Building Pittsburgh, Pa.

Cut Your Feed Grinding Costs

Do your own grinding. Save half the gasoline expense other grinders require Grind wagon load an hour at cost of 15 cents.

HOWELL *Roller Feed Mills*

grind feed or rye and graham flour one-half cheaper than buhr mills. Built on same principles as modern custom mills. No buhrs, no stone to wear out. Efficient, economical, safe. Guaranteed to get the wild oats. Give lifetime service.

13 Sizes—any capacity—a size for every engine. Write for catalog. **R. R. HOWELL & CO.,** 4 Malcolm Ave. S. E., **Minneapolis, Minn.**

"You'll Always Find"

says the Good Judge

That you get more genuine satisfaction at less cost when you use this class of tobacco.

A small chew lasts so much longer than a big chew of the ordinary kind. And the full, rich real tobacco taste gives a long lasting chewing satisfaction.

Any man who uses the Real Tobacco Chew will tell you that.

Put up in two styles

W-B CUT is a long fine-cut tobacco
RIGHT CUT is a short-cut tobacco

Weyman-Bruton Company, 1107 Broadway, New York City

The Jersey—Premier Butter Breed

(Continued from page 998)

made in her first four lactation periods 3,596.85 lbs. fat. This exceeds Sophie 19th of Hood Farm's first four records by 843 lbs., and the first four records of the best persistency record of other breeds by 577 lbs. Plain Mary, the present champion of the breed, produced 15,255.9 lbs. milk, 1,040.07 lbs. fat, in a year.

The Jersey cow has given a good account of herself in production tests. There are now completed 15,000 yearly records and 7,200 cows are on test. In the largest public breed test, that at the St. Louis Exposition in 1904, twenty-five American bred Jerseys represented the breed and won the test. The winning cow was a Jersey. Thirteen of the leading fifteen cows in the test were Jerseys, as were nineteen of the first twenty-five. The average of all Register of Merit records completed is around 7,800 lbs. of milk containing about 420 lbs. fat.

The Jersey's Future

The dairy farmer's preference for the type of the American bred Jersey may not prove her superior to the Island cow. That is not necessary. The fact is the American farmer wants size in his cow. He has indicated definitely enough that he will not accept the small typed cow from the Island. The Jersey's future here depends on the willingness to place increased emphasis on production. Perhaps the breed may profit from the lesson of Mohammed and betake itself to the mountain. If the farmer can have the type he desires, the cow will do the rest and the breed will more nearly reach the end sought in the Club's slogan to make the Jersey "Everybody's cow everywhere."

The office of the American Jersey Cattle Club is at 324 West 23rd St., New York City. R. M. Gow is secretary.

Dairying Thirty Years Ago

Taken from the Issue of Hoard's Dairyman of December 26, 1890

Will any sort of legislation keep unhoused agricultural machinery from going to decay?

Oleomargarine Seizures

Pittsburg, Pa., Dec. 11—Collector Warmcastle today seized $10,000 worth of oleomargarine in the wholesale stores of the Western Butter Company and the Keystone Butter Company. This is but the first of a wholesale seizure, as the companies are accused of scratching the stamps from the oleo kegs and selling to retailers, who dispose of the "butter".

The retailers will also be proceeded against. They are in a peculiar position. If they do not buy a United States stamp, both the government and state will be after them, and if they do, the state will sue, as a state license prohibits the selling entirely. A score of prominent firms are involved.

Good judgment of foods and the laws that govern them is worth a fortune, especially to a dairy farmer. The cow is a very deep and profound fact in the sum of his existence. It is a question every hour in the day with him whether he is measuring that cow by the standards of good or bad judgment. It is not talent but correct judgment that helps the dairy farmer along. To have sound judgment he must have correct knowledge of the cow and the treatment that is due her if profit is expected from her. One thing more is necessary. He must be an energetic man. If he is lazy or indifferent in his desire for knowledge—lazy in his mental digestion of it, lazy in the formation and execution of his judgment, he will have a lazy man's reward, and there is no help for it.

There is hardly a family in the land that ought not to consume double the milk and the products of it, that it now does; nor scarce one that would not get its compensation for such additional consumption of dairy food in better health and a saving of money expended for food not so good.

A Canadian expert claims as a result of experiments that twice as much food is needed to maintain a 1,000-lb. cow at a temperature of 32 degrees as is needed at 68 degrees. Every degree of heat less takes 2 per cent of the food to make up the loss. It is easy to figure from this scientific basis the value of a warm barn.—A Live Stockman.

Senate Passes Collective Bargaining Bill

The collective bargaining bill passed the Senate December 15 and now goes to conference. This bill authorizes "farmers, planters, ranchmen, fruit growers, and dairymen" to organize for the purpose of marketing their products in interstate and foreign commerce. It provides for collective processing, preparing for marketing, and handling in selling of everything grown on the farm. The associations, according to the provisions of the bill, can operate with or without capital and can make any necessary contracts or agreements to carry the provisions of the bill into effect, so long as the organization is run for the benefit of its members.

The federal trade commission has the power, by this bill, to determine when such associations as are formed under its provisions are too strongly influencing prices. If the commission's recommendations in such cases are not followed, complaints may be taken to the federal courts.

The bill is reported to have met considerable opposition in the Senate but the southern and western combination of votes passed it.

Last of California Educational Butter Scoring

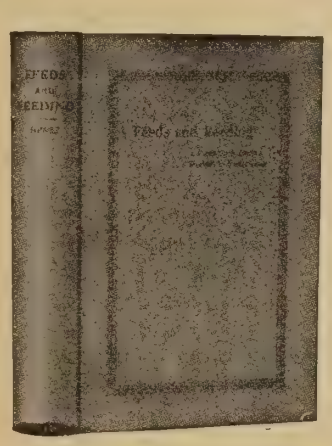
In connection with the convention of the California Butter, Cheese, and Ice Cream Makers' Association, was held the Third Educational Butter and Cheese Scoring Contest, in which T. J. Harris and G. D. Turnbow acted as judges.

There were fifteen entries of butter. Mr. John Reichneuth of the Bodega Co-operative Creamery won first, with a score of 96.625, second place was won by G. R. Jaehnig of the University Farm Creamery, with a score of 96.25, and third place was won by Harry Wolf of the Crystal Creamery Company with a score of 96.125. Mr. Sommers of the Northern California Milk Producers' Association won first in cheese, with a score of 92½. Mr. Hyatt of the University Farm Creamery won second, with a score of 92. One remarkable feature of the contest is the fact that all but one of the fifteen entries of butter received a perfect score on composition. This is by far the most remarkable record ever made in any of the contests conducted by the University.

This is the last of the 1920 contests and the results will be announced shortly and the award of the certificates of merit made.

California. G. D. TURNBOW.

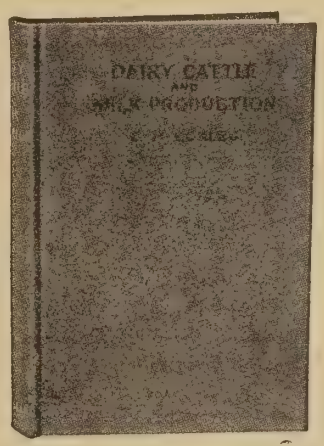
"I SHALL pass through this world but once. Any good, therefore, that I can do or any kindness I can show to any human being let me do it now — for I shall not pass this way again."



As you read this Christmas issue of HOARD'S DAIRYMAN and think of the many other issues you have received, and will receive all containing some bit of practical help or inspiration to you — *don't you think, at the same time, of many neighbors and friends who need and would enjoy the "Dairy Gospel" as much as you do?*

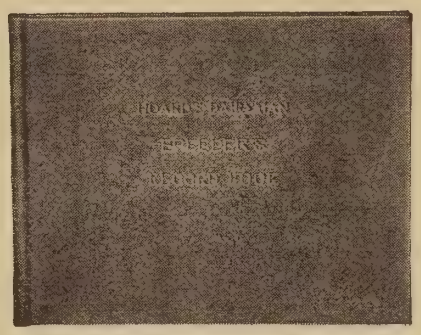
HOW better could you express the spirit of good will that is in the air these days than to step to the phone and say something like this to those good men:

"Bill, I have just been reading the Christmas issue of Hoard's Dairyman and while I was reading it the thought came to me that you would enjoy reading such a paper. I am going to send in my subscription today — why not let me send yours with it? Read it this year on my say-so! How much? $1.00 per year — or three years for $2.00. I always take it for three years at a time. Don't have to bother renewing so often that way. What do you say, Bill? Glad to do it — and you'll never be sorry! Good-bye'."



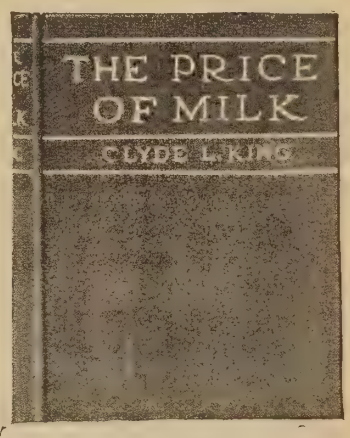
If you will go out of your way just that much to help your friends and Hoard's Dairyman, we shall be pleased indeed to send you, in return, for your trouble, any one or all of the books below. They are four of the best books in our library; books that any dairy farmer could read with interest and with profit.

Pick out the one you want, step to the 'phone — and give Hoard's Dairyman, the "other fellow" and yourself a lift!



"FEEDS AND FEEDING"—Henry

The very latest edition. 701 pages—and every page loaded with facts regarding the feeds for and feeding of domestic animals for profit. This book is the result of a life time of research and study on the part of W. A. Henry, formerly Dean of the Wisconsin Agricultural College, a book that it will pay you to study. The price of this book is $3.85, but we shall gladly send it to you for a club of six subscriptions (either new or renewal and either one year for $1.00, or three years for $2.00 each.)



"DAIRY CATTLE AND MILK PRODUCTION—Eckles

A book which we'd like to sell every reader of ours who is interested in dairy farming. It is a complete and practical summary of the various breeds of dairy cattle, pointing out their respective characteristics and adaptability to various conditions, the judging and selecton of the individual cow, calf feeding and raising, management of a dairy herd, stable construction and dairy farm management are ably discussed. The price of this book is $2.00, but we shall gladly send it to you for a club of five subscriptions (either new or renewal and either one year for $1.00 or three years for $2.00 each.

"THE BREEDERS' RECORD BOOK"

For the breeder of registered stock. 96 pages—and on each page is space for a sketch of the animal, a five generation pedigree, the breeding record, and the production record. This book is very nicely bound in a good cloth cover and lettered in gold on the front cover. We have sold hundreds of these pedigree books to our readers, and have received many compliments on their appearance and practicability.: The price is $2.50, but we shall gladly send it to you for a club of four subscriptions (either new or renewal and either one year for $1.00, or three years for $2.00 each.)

"THE PRICE OF MILK"—Clyde L. King

In a few weeks since this book appeared it has established its place beside "Feeds and Feeding", "Dairy Cattle and Milk Production", and the other books that are a constant source of help for the seeker after reliable information on dairy questions. The discussion of this subject is sane and reliable. It is a book that every milk producer should read and study, so as to understand the problems and economic fundamentals of the marketing question. The price of this book is $2.00, but we shall gladly send it to you for a club of four subscriptions (either new or renewal and either one year for $1.00 or three years for $2.00 each.)

A DEPARTMENT FOR THE DAIRY FARM BOY

Christmas At Cloverdale

"WHY, Bob, where did you come from?" exclaimed his mother, rushing forward with extended arms to greet him. "College hasn't closed yet, has it? I hope you are not sick, dear," and she searched the depths of his penetrating blue eyes, to find there a trace of evidence that her suspicions were or were not well founded.

"Nothing's the matter with me, mother, excepting that I'm ready for some of that dinner I smell frying out there," as he jerked his head in the direction of the open kitchen door. "Golly, but I did hoof it out here, mother! Only took me forty-five minutes to make four miles and I wouldn't brag about the condition of the roads either. Never saw them so bad to Cloverdale," he added, "and I'll admit it made me tired, mother," as he fell into the nearest chair and, like most other boys, he tossed his cap in the direction of its accustomed place in the corner of the kitchen he had always claimed as his.

"Well, I'm surely warm, yes, hot," he complained as he ran his fingers through his damp hair. "I must be getting soft indeed if I can't stand that walk without warming up in this way. Who's out there, mother?" he whispered, pointing in the direction his cap had taken. "I heard a noise like someone walking around. Got a maid now?"

"Aunt Ella," came the whispered reply. "She's been here a month, and I don't see any signs of preparations for her leaving either," she smiled. "But you know, dear, Aunt Ella's always welcome."

"What's matter, don't they get along well?" he grinned mischievously. "If they don't, I'll bet it isn't uncle's fault. Aunt Ella's too much like the Pilgrim fathers, or maybe mothers would sound better," he added dryly. "Too stern and too set in her relations with other people! Fine time we'll have this Christmas with her sticking 'round. Well, if she starts any of her sermons to me, I know what I'll do, just do as I please," and he arose to remove the heavy cardinal sweater which was not adding anything to his comfort.

"But you haven't said why you came this early," spoke his mother as she followed him from place to place about the room.

"Nothing important about that, mother. I just got through with my exam's earlier than I had expected to, so there wasn't any use in sticking 'round any longer than that. Jimmy came, too," he volunteered.

"Well, it's too bad that we didn't know you were coming, Bob, so father could have met you at the station and, besides, your favorite Pete needs the driving. He acts like a two-year-old every time he is led out to the trough, I'm almost afraid to have your father hitch him up alone. He is such a cut-up."

"I'll take that out of him before I go back," said Bob stoutly. "Guess we both need the exercise for that matter. Where's dad?" he inquired. "Doing chores I suppose. Guess I'll go out and give him a lift, incidentally surprise him too," and as he stepped toward the kitchen to get his cap, he was greeted by Aunt Ella's form blocking the doorway.

"Merry Christmas, Aunt Ella!" he cordially exclaimed, extending a hand toward her which she took, it seemed, only because she was forced to. "Aren't you going to give me one of your baby kisses?" he laughed, trying to be himself in her cold presence.

"No, sir, I'm not," she cut him short. "You're too big to be kissed by any one excepting your mother; besides, there might be other babies to be kissed now, who may be just a little more deserving than you are."

"Bet I've got a new cousin, Aunt Ella! Come show him up," he teased, of course not believing a word he was saying.

Much to his surprise, Aunt Ella had no come-back, but merely gave him a half pleasant smile as she turned to her work in the kitchen, while Bob prepared to make for the barn to assist in the evening chores. "Oh, I wish she had some children of her own, then maybe she would let me alone," and he planted a tender kiss upon his mother's soft cheek.

DAD ENJOYED THE TRIP TO MEET MARY AND PETE NEEDED THE EXERCISE

"Now don't you two stay out there and let everything grow cold before coming into supper," she warned with a threatening finger. "Dad's been out there long enough now to have everything done up by this time. Why, I didn't realize it was quarter of six," as she looked up at the big timepiece that had faithfully regulated the Ramsay doings since the birth of Bob.

"I'll hustle him in, mother; 'twon't take the two of us very long to finish up, and don't you go and try to soothe Aunt Ella's feelings either when I'm gone by telling her that I didn't mean what I said," he whispered. "I did mean every word of it, and if she opens up on me again with that line of stuff, I'll go and spend Christmas with uncle," and away he dashed to the barns.

"Spot, you old rascal," he called to the dog which had been but a puppy when he left home for the first time. "Don't you dare growl at me; I'm your one boss, don't you know that and if it hadn't been for me, where would you be today! Yes, where would you be today," he repeated as he hugged the wriggling dog. "Awful glad to see me, aren't you, old boy, but don't put your dirty paws on my new clothes," and he playfully slapped him across the ears with his gloves. "Come on now, let's go and find dad."

At the mention of dad, away Spot tore up the steps leading to the well filled mows of fragrant alfalfa. Then he stood at the top of the trap door, looking intently down while all the time he kept up a continuous whine of joy as he waited for Bob to come.

"Say, old man, you don't play fair," scolded Bob. "Why didn't you wait for me; that's no way for a friend to act. I wanted to surprise dad and here you've gone and given the secret away." But Spot only looked dog-wise at him and again proceeded to express his emotions by jumping all over him once more.

"Who's there?" called his father from the mow.

"Hey, dad, if you don't take care of your dog and teach him better manners, I'll give him a beating up and then I'll come up there and treat you the same. Guess you both need it anyway," he snickered.

"Well, by jinks, by gum," his father yelled down at him. "Dreams are funny things!"

"What's that got to do with me, dad? I'm not a dream; I'm a regular guy, and I've come to take a few square meals with you, haven't I, Spot?" grabbing the dog bodily and tossing him over onto the loose pile of alfalfa that lay upon the floor.

By this time his father had reached the bottom of the ladder, exclaiming, "Where are you, you little son-of-a-Ramsay?" whereupon Bob reached up from where he was sitting, caught the tail of his father's leather chore coat and with a tug brought him down onto the pile of hay between himself and Spot. "Now, am I a dream?", he laughed as the two hugged each other, as his mother had always accused them of doing in regular school girl fashion.

"How did you get here so early?", but before Bob could make reply, he added, "I dreamed last night that you came home yesterday; that you were fired from the agricultural college for not 'tending to business and now here you are! Come across and explain," knowing full well that Bob would not disappoint him. Too great had always been his confidence for that.

And when Bob had explained all, his father hopped up and did a few fancy steps on the chaff-covered floor, saying as he finished, "Big doings for your ma and me now, son. We do get lonesome for you at times and I wouldn't give a tinker's d— if you were only through with it all."

"I feel the same too, dad, but time goes fast and I'll soon be here again for good and I'll bring you and mother a daughter, who'll make things lively enough 'round here for you both. Now we must go into supper, dad. We can't stand here talking and keep mother waiting and allow a perfectly good meal to get cold. Come on, let's go," as he took his father by the arm. "I'll help you feed after supper, 'twon't take us long."

"Guess you are saying two words for yourself and one for mother," joked his father. "Well, you always did like to eat and I see you haven't gotten over it yet," as they walked out of the barn.

"Mother!" exclaimed Bob as he opened the door and entered to the tune of a pair of youthful lungs being exercised to their limit. "Why, dad, you,"—but just then his mother stepped in from one of the bed rooms. "Mother!" and he stared first at her and then at his father; "what does this mean? Are you keeping any secrets from me? Have I got a little sister or, better, a brother?" he begged excitedly. "Where is he?"

His father broke into a loud laugh. "Bring them out, Ella; you can't keep it a secret any longer. I told you it wouldn't work! Bring them out and present Bob with his Christmas gift. "But Bob couldn't wait. He had already disappeared and when he showed up again, he was carrying two husky baby boys, cradle and all, followed by his aunt who was threatening him with everything she could think of if he spilled them in his haste.

"Well, if that isn't a bird of a pair!" he exclaimed peering into their tiny faces with their blinking eyes. "From what children's home did you get them, auntie? Do you know their ancestry? You know you might raise them only to break your heart," he added mischievously.

"If you'll give me time, young man, I'll tell you all about them," she began, but somewhat embarrassed as she noted the fun her brother John was having out of the awkward situation in which she had been placed. "They are from my own home, Bob, and their ancestry is a good deal like yours for I am their mother, and I don't think they will grow up to break mine or any one else's heart either. "Jimmy here," and she stroked the head of the one who had been making all the noise, "is the twin brother of Bob, and this is Bob," as she lifted the other from his warm bed and laid him gently in his arms. "They are mine, both mine," she said with pride, "and you can claim them

for your cousins, if you wish to. Now what have you got to say?"

"Well, let me collect my senses, Aunt Ella. This just about excels the Einstein theory if what you've said is true. You make the eighth natural wonder of the world," he laughed aloud. "And so you thought you would surprise me on Christmas morning with this present, did you? But good for you, Bob, Jr., for giving the secret away as soon as you did," and he brought the tiny bundle of flesh and soft white clothes up to his face, and gently kissed the delicate little mouth.

"Oh, Bob! Mind! Don't do that," exclaimed his aunt in alarm." 'Tisn't good to kiss babies on their mouths. They might catch germs," she admonished, "and you must be very careful about that hereafter."

"Germs, nothing," answered Bob in disgust. "That's what the mouth is partially made for, that and eating, and if it was used more for those purposes and less for talking, we'd all be better off, at least that's been my experience," he grinned in the direction of his father. "Uncle must have had a funny courting experience, if you made him practice what you are preaching. All right though, I'll obey you in this matter, if you'll remember what I said this afternoon," and both smiled sheepishly at the other. "Ready to give me my kiss now, auntie?" he further teased. "The one which you refused this afternoon, and I'll let you plant it right where it belongs, too.

"How do you think Jimmy Greene will like his namesake, Bob?" she asked.

"Like it!" he returned. "He'll be as proud as he was when he was elected captain of the football team. He'll have to like it or I'll know the reason why. 'Twas a great idea to name them after us, Aunt Ella. What made you do it? You couldn't have done better!"

"Oh, I thought it would be nice to have my boys named after two big men, because I am sure now that you and Jimmy will be two of the best men this community has ever turned out, and it will be a fine thing to have you two for ideals. You know example is a great thing, Bob."

"Guess my batting average is going up some," he commented. "We'll try to make them walk the narrow path though and I hope that neither we nor they will ever disappoint the high ambitions you have always had for us," he seriously added.

The long evening wore slowly away as the happy family sat about the room enjoying the warmth of the cheerful fireplace. Bob had popped enough corn for a family of twice the size, and his mother had filled the big fruit dish with rosy apples from the well stocked cellar. They had talked about everything of interest that had happened since Bob had left home that fall, when suddenly his father broke out with, "Mother, we might just as well tell our other secret, seeing that Bob already knows Aunt Ella's. You're too old to have to wait for Santa Claus, aren't you, son, and seeing that Christmas is but a few days away, we might just as well let old Santa in tonight and get the excitement over with. What do you say, mother?"

"I guess it doesn't make much difference, father," she replied, studying the puzzled expression on Bob's face, "and certainly not now that you have mentioned it. "I knew that you couldn't keep it at the time we planned it should be a secret. You've been uneasy all evening about it, just waiting for an opportunity to spring it. So now go on; get it off your mind, so you'll be able to sleep tonight," she smiled.

"This is the most peculiar Christmas I've ever had," broke in Bob. "Everybody acts so mysterious like! Secrets about everything! Wish I had planned a few too, to keep you all guessing." But the truth of the matter was that he did have a secret for them, and he had determined to keep it as such. He had asked Mary, the girl he expected to be the future Mrs. Bob Ramsay, to spend Christmas and the few days following at his home and she had gladly consented to do so. And so they had planned to keep it as a surprise until she really arrived at Cloverdale.

"There's nothing very mysterious about what we have to tell," began his father. "I've been thinking of this for a long time and it is but recently I have been able to put it across. You remember the old Jenkins' place that joins us on the other side of the forty acres across the road? Well, it's ours now, son; I bought it shortly after you left for college this fall."

"I don't see why you wanted to keep that a secret," Bob interrupted. "Why didn't you write that to me in one of your letters, mother?"

"You'll see why, son, if you will be patient," she replied.

"Go on then, father," he anxiously urged. Then turning to Aunt Ella he added, "Patience is one virtue though which I don't seem to have."

"As I said," contir ued the father, "that farm is now ours; that is, it belongs to the firm of John Ramsay & Son at present."

"But, father," broke in Bob, "we've got enough already; what do we want with more?"

THE CHRISTMAS QUARTETTE FOR THE NICOLETTI BOYS

"You see, son, it's like this. First of all I got the place for a song and, as I had the money, I figured it would be a good place to invest it. And now for the secret!" By this time Bob was so interested that he was up on his feet, standing directly in front of his father.

"Now, my boy, when you are through with your college training, and that isn't very far away either, you may want a farm of your own; not that we don't want you to come and live with us, but because we really think you will want your own home, according to the plans you seem to be making. But if for any reason those plans do not mature, you are welcome to stay right here with me. But it will be up to you to make your choice, and now here is the deed to the farm," as he drew it forth from the deep pocket of his smoking jacket. "It's yours, son, from now on and it is all your mother and I could afford to give you this Christmas, and still hold the good will of Santa."

"'I don't know what to say, dad," answered Bob, as he started to pace before the fireplace. "It would be useless for me to jump up and down, clapping my hands and saying how delighted I am like I used to at other Christmases. You and mother both know that I can't begin to thank you for all that has already been done for me, and since I can't decide right now what will happen when I am through college, I'll have to expect the farm to be run under our firm name for the next few years. But it will make so much work for you to look after, dad."

"That's just it, son, but I am safeguarded. I looked out for that. Since you now have the deed, the job of seeing that the farm is properly conducted will be up to you. It can be done, even though you are in college. You'll be home often enough to advise your renter, and it will give you a chance to put some of those pet theories the professors are teaching you into practice. You won't have to worry about the help situation right away for there is a family living on it at the present time, and it will take them a few years to make enough to even consider moving. I've got that family of Italians that worked our sugar beets this summer, living on the place. They are a thrifty bunch, son, and I'll bet this farm against yours that they will make good. So there you are and you can go to farming now as soon as you wish," he concluded in happy satisfaction.

"Do you mean to say, dad, that those Nicollettis are living there? Why, they can't work as much land as that! Angelo, Pietro, and Mario are nothing but kids! Antonio is the only one who will be of any consequence for some time!"

"Don't fool yourself, son. Those kids, as you call them, can hoe about as many beets in a day as the old man and Antonio can. Besides, Lina, Mario, and Giuseppina work outside just like men. You musn't measure these foreigners like you do Americans. They are accustomed to working and they all pitch in."

"Yes, but what agreement did you make with them?" asked Bob.

"Not any, that's up to you. They're waiting for you to make them one. I told Pietro, Sr., that everything would be all right, and to go ahead and do as much of the fall work as possible and, let me tell you, every acre that could be plowed this fall has been turned over. So I guess they are pretty anxious for you to come over and fix up the deal."

Bob's face was flushed with the excitement of future possibilities. "Guess I better get to bed while I'm able," he laughed. "My head is certainly beginning to whirl at the thought of so much on my hands." Then, turning to his father again, he asked, "Is there any stock on the place, dad? And before giving him time to answer, he added, "Of course they will have to run a dairy farm in this section or they'd starve to death. That's a cinch, isn't it, dad?"

"That'll be up to you and Nicoletti, son. But answering your first question about the stock on the place; they have a few head, nothing to speak of though, and now, mother, I guess we are ready for your part of the secret," he suggested with a mischievous twinkle in his eyes.

"More secrets!" cried Bob, quickly facing his mother. "No, no! I've had all I can stand for one dose; if there are any more, keep them for tomorrow."

"Sorry, son, if you can't bear the load, but it is very necessary for you to know all tonight now that your father has opened up everything in this way, and since I haven't told any secrets, I think it is my turn. I'll make mine short," she smiled at the family.

"All of your Nicollettis are to be with us on Christmas Day, Bob. We have invited them for dinner and we want them to see what a real American Christmas is like. Dad has saved a pure-bred calf for each of the boys. This will be their Christmas gift from us all, and I am giving the girls new dresses. This will give them a good start toward a good herd of cattle and it will make the boys appreciate the advantages of a good stock. We don't want any more scrub stock to come into the neighborhood if we can help it. It's taken a long time to educate people away from it," she concluded. "And now what do you think of my secret, son?"

"The best yet, mother! It's all so splendid! Won't they enjoy one of your good dinners, and to think of the presents you are going to give them! Mother, you are great! And I'll just bet back of it all your scheme is to try to Americanize them as quickly as possible."

"Now the big thing for tomorrow is to get ready for them. It means work for everybody," she emphasized, "so I think we had better be off to bed," and she arose to make the first move. The others quickly followed, and as Bob started for the stairway his father slyly cautioned, "Remember you're on the farm now, Bob; no college hours here; feeding starts at six o'clock."

"Don't worry about me, dad; I'll beat you to it, see if I don't," and up the steps he dashed, calling good night to every one as he went. "Gosh, but this is all so strange," he chuckled to himself as he jumped into bed. "Whoap! There they go," as the crying of his cousins reached his ears. "Bet I woke them up when I dashed up the steps! Go to it, you little rascals," he laughed, as he pulled the covers up over his head to shut out the noise. "Give Aunt Ella enough to think about so that she'll mind her own affairs from now on." Quietness soon settled over the household, however, and Bob was farming in his dreams.

True to his prediction, he was the first one out the next morning. The fire in the kitchen range was throwing its warmth to all corners of the room as the pitch filled tamarack crackled and snapped in its grates. "Everything's fired up, dad," he said as the latter started for the furnace room. "I've been down there and I guess I caught it just in time. We should have banked it better last night."

The before-breakfast chores were completed in a hurry, consequently the men were in for breakfast before it was ready. "Guess I'll phone Pietro," remarked Bob to his father, "and tell him that I'll be over some time this morning to make him a proposition about the farm," and he stepped toward the phone. "Or won't they be up yet?"

"Up! I should say they would be," answered his father. "They've had breakfast by this time. Mrs. is trained to get up in the morning," he winked at Bob, at the same time glancing in the direction of his wife who was fussing over the eggs that were spattering in the frying pan. "But I'd ask him to come over here," he suggested. "Remember he is your renter."

"Good idea, dad," he said as he took down the receiver and called for the

Wanted—Position by two first-class young men in large dairy barn. Satisfaction guaranteed. $85 month and board each. Address BOX 524, care Hoard's Dairyman.

New York Butter Market

NEW YORK CITY, DECEMBER 14—A substantial recovery in Danish exchange during the past week has served to revive interest in the butter market. The increase in the value of Danish money makes it necessary that the Danes receive fully 3½c more for their butter than before the advance in order that they may net last week's price for it. One result of the advance in exchange is the withdrawal of 2,000 casks of consigned Danish butter, which arrived in a shipment of 10,070 casks last week, from sale as the exporters feel that they must receive a greater price than the one that now prevails for their butter. It is generally felt that there will be lighter shipments of Danish butter during the coming months than have been expected. It is quite possible that Danish exchange may again decline if shipments are curtailed as the Danes are buying freely of feeds in this country and the balance of trade between the two countries may become so favorable to the United States that a further slump can not be avoided. In that event shipments will undoubtedly become larger.

With the advance in Danish exchange, receivers became more optimistic with the result that there has been an upward trend to butter prices for the last several days. Buyers, who are quick to note changes in sentiment among receivers, have become more active and have shifted much of their buying back to tubs. Danish butter which was moving readily is now dragging to a considerable degree. In addition, much of the last shipment is very moldy and is not up to standard in other respects. The prevailing price of Danish butter, in wholesale lots, is 49@51½c, although that of poorer quality is selling as low as 47c in some instances.

The latter part of last week brought forth a rumor that there was an awakening of export demand for butter. It has been found, however, that there was no foundation to the report as there was no purchasing of American butter to fill foreign orders. The rumor started because of a Canadian deal with England which affected some Canadian butter that was being held in this city. At the present time there is little likelihood that England or any other European country will purchase any of our butter. The Food Control of England will continue in operation until the passing of winter which means that individual butter handlers in that country will not be allowed to purchase foreign butter on their own initiative.

On last week Monday, the quotations on high grade butter advanced one-half cent and the price of extras became firmly established at 52c. The market continued to gather strength but there was no further change in quotation until Thursday when the price advanced 1½c. There was no change in that quotation until yesterday when there was an advance of one-half cent and it was followed by a similar advance today. While the price trend is upward for fancy butter, undergrades remain unchanged. The principal reason for that is the fact that there are considerable quantities of Argentine butter in local stores and warehouses that can be purchased at prices as low as 36@38c. As that butter is of the quality of fair seconds, it is extremely hard to move domestic seconds at any price. Good commercial firsts are at a disadvantage as they must compete in price with high quality Danish butter. That fact is tending to cause a very wide range in the quotations on firsts. With the curtailment of shipments of Danish butter, if such a condition does materialize, it is expected that there will be a greater demand for medium to low quality butter. Established quotations today are as follows: Extras (92 score), 54½c; higher scoring than extras (93 score or higher), 55@55½c; firsts (90—91 score), 46@53½c; firsts (88—89 score), 41@45c; and seconds (83—87 score), 36@40c.—W. B. LIVERANCE.

MARKETS

CHICAGO, Dec. 16—Butter—Creamery, extras, 51c; standards, 43¾c; dairy firsts, 37@47c; seconds, 33@36c.

CHRISTMAS AT CLOVERDALE

(Continued from page 1013)

number of the Nicollettis. "Hello, Pietro, this is Bob," he began.

"Who dissa man?" came the response.

"Can't you hear me, Pietro? This is Bob," he repeated.

"Ah, yessa! De begga de Ramsay boy," came this time.

Then Bob began to giggle as he hear Pietro yell to some of the noisy children. "Stoppa dat a noise," he heard him say to one of the boys who was evidently trying his musical ability on an old accordion. Then before Bob had time to send another word, Pietro apologized by saying, "Mario, he likka to make a begga de music."

"Sounded fine, Pietro," said Bob, "but say, Pietro, can you come over this morning, say about nine o'clock?"

"Sure I comma, and I bringa de old woman and alla de kids too," he volunteered.

"No, Pietro, I only want you today. You'll all come tomorrow."

"Alla right, Meester Ramsay, but I tinka you wanta to see all my familie; it's alla right though, so I comma alone dissa time."

"That's right, Pietro," returned Bob, "and I'll expect you not later than ten anyway," and he hung up the receiver, chuckling to himself as he sat down to breakfast. Following the meal, he beckoned his father into the latter's office, quietly closing the door after them. "Now what?" asked his father raising a quizzical brow.

"I didn't intend to let you in on this, dad," he began, "but I see that I am forced to. I've made a bad mess of things by asking Pietro over this morning. You see I've asked Mary to spend Christmas with us and she has accepted and she'll be here on the 10:15. Now if I keep my appointment with Pietro, I'll have to ask you to meet her at the station, much as I hate to disappoint her."

"Maybe she won't be so disappointed as you think, son," he answered slyly, "especially when she sees your father."

"I'll trust you, dad, with all your charm for girls," he laughed back. "But will you go?"

"Wouldn't miss the opportunity, my boy! In fact, I shall be delighted! But how will I know her?"

"Easy, dad," came the quick reply. "Just walk up and down and introduce yourself to the swellest looker that gets off that train. And that will be Mary! Nothing like her ever gets off at this burg, so you can't very well make a mistake," he boasted.

"I'll be on the job, son, but don't you get jealous if Mary takes a liking to me," he joked.

"Hope she does," he replied dryly, "because she is all that I have to give you and mother for Christmas," as the two left the room.

"What have you two been whispering about now?" asked his mother. "Up to some mischief, I suppose! I haven't seen dad act like this for some time, Bob. What have you been telling him?"

"Just gave him his Christmas present, mother, or at least told him what it's going to be," he carelessly answered, winking at his father.

"What did he give you, father?" she asked in all seriousness.

"Don't know yet. Got to go to the city and get it myself," he replied, struggling into the fur of his beaver overcoat.

"Dad will bring yours in the same package, mother, so you needn't look so jealous. He understands that he is to share equally with you, don't you, dad?"

"Excepting that I have the advantage of seeing it first," he laughed as he left the house.

Pietro arrived at the appointed hour, and after what he tried to make a formal greeting of the family, but more foreign than formal, he was ushered into Bob's father's office, followed by Bob. "Well, how do you like the farm, Pietro?" was Bob's first question.

"I likka it fine," came the quick, emphatic reply.

"Well, it should not take long then for us to reach an agreement, Pietro."

"Only dissa," he quickly interjected. "De old woman and me, we likka to own alla de stock; de horse, de cow, and de peeg; how dat strikka you?" he asked, evidently intent upon the ownership of something.

"Yes, but you've got to have more than one horse, and more than one cow and pig, Pietro," Bob trifled.

"Yessa, yessa," he replied to this excitedly. "But we wanta alla dem, you know."

"Just what I was going to suggest, Pietro. It will be much better for you to own all of the stock, at least until I come home for good; then we can make other changes if necessary. So that's easily settled. Now I am going to rent you the place Pietro for a period of three years, providing you want it for that long and that you live up to your part of the agreement we make here today. You are to stock the place, and provide sufficient machinery to run it with, and for your share you are to take two-thirds of the gross returns and I will take one-third. We'll split even on the taxes and building insurance and also on repairs of buildings and fences. Any new buildings go up at my personal expense. Little things like what crops to grow and how to treat the soil, well, we can just work together on those; that will be best, I think. I'll be over next week with the papers."

Pietro had listened intently and it was quite certain that he was satisfied, for as they arose to leave, he searched his ragged pocket and brought forth two cigars, one of which he stuck into his mouth, while the other was offered to Bob, saying as he did so, "I bringa you a beega, blacka ceegar, and I hope you likka dat too, likka I do!"

To which Bob answered, "No thanks, Pietro; I don't smoke." A disappointed expression spread over his face as he returned it to his pocket, and he added as if to pass it off, "we alla comma tomorrow to deener," and then he started away.

Bob's father arrived with Mary at about eleven. Bob was not only excited from the morning's events, but in addition quite plainly embarrassed now as he turned Mary over to his mother and Aunt Ella. His mother, too, was a trifle upset at the unexpected arrival, but she soon recovered her usual composure and Mary was made to feel as though she had always known the entire family. Bob was elated at the reception accorded Mary. As he said to his father later on in the day, "I knew you'd like her, dad, and do you blame me?"

"Only wish I was young again," he replied with a roughish smile. That afternoon Bob and Mary went to cut a Christmas tree, while his mother and father drove to town to get the trimmings and to do some other Christmas shopping, and the evening was spent in putting on the finishing touches in readiness for the Nicollettis. The family retired early, with the exception of Bob and Mary who were left to themselves to talk things over,

as his father remarked before leaving them. And talking wasn't all that took place, for the diamond which Mary flashed on her left third finger the next morning did not fail to catch the observing eye of Mr. Ramsay as the family sat at the breakfast table. Bob noted that the discovery had been made and he knew it would be followed up with remarks that would probably be a little embarrassing to both himself and Mary. Then as if to avert some catastrophe, he broke out with, "Mother and dad, here is your Christmas gift," as he covered Mary's ring finger with his hand. "And this is the proof," as he exposed the ring. "Mary is now to be considered a part of our family, at least I hope so," he blushed.

A brief silence followed. Aunt Ella straightened up and moved uneasily in her chair. She was indignant; that was quite certain. Not that she didn't like Mary, but just because she had always allowed herself to act this way with everything that concerned Bob. But she kept her silence for which Bob was thankful.

"Ahem, ahem," came from his father as he prepared for action. Then much to the relief of the two young people, he began. "My dear son and Mary, I know how you both feel. This is one of the happiest moments in your lives, or perhaps it would be more appropriate to have said this along about midnight," he wisely corrected. "Whatever makes you happy, son, adds happiness to the lives of your mother and me, and all that I can add at this time is that we hope you always will be as happy in each other's companionship as you are now. Mary, we gladly accept you into the family circle, and now I wish to congratulate you both," as he arose and shook hands warmly with each of them.

Mrs. Ramsay was too deeply affected to say anything, and, as Bob saw her wipe a tear away, he said, "Never mind, mother, I shall always be your boy. Mary has agreed to share me equally with you," he gulped, trying hard to swallow the lump that had risen in his throat.

By ten-thirty, the chores had all been finished up and the family was in readiness to receive the Nicollettis by eleven. Nor did they have long to wait after that, for across the frozen forty they came stringing along, the elder Pietro leading the way.

"Looks like we are going to entertain all Italy," Bob snickered, his face pressed close to the cold window pane. "They're all there, at least I have counted nine of them. But mother, Mrs. is carrying a small red bundle and she handles it like a baby."

"That's what it is, son. Caruso is the youngest; he is now about three months old."

"You didn't say anything about that, dad, when we were talking about the family. "Well, I am satisfied if Pietro is," he laughed. "It means another farm hand in about three years. How would you like to own all of them, Mary?" but Mary only blushed as she glanced shyly toward his father, and Bob realized he had made a mistake.

Mrs. Ramsay was at the door to greet them with a Merry Christmas, and as fast as they were released from the grip of her warm hand shake, Bob and Mary ushered them into the cheerful warmth of the big living room. There were no formalities to contend with as Bob had said in cases like this, and he was right for all felt at ease at once. Mary had all she could do to keep the younger members of the family entertained, but she proved herself equal to the occasion, although it was a difficult task, for like most children they all wanted that which they could not have. Finally she hit upon a program, the charm of which worked its wonders. She sat down at the piano and began to play an Italian Christmas hymn. Instantly the room was quiet, and the Mrs. Nicolletti smiled her satisfaction and pleasure at Pietro and hugged the tiny Caruso just a little closer to her breast. But when Mary's sweet voice broke into words, she was completely hypnotized. The comfortable rocker in which she sat ceased its rocking and its occupant sat stone-like, staring the depths of her dark eyes into Mary.

"Ah, you angel, you blesseda angel," she commented when Mary had finished. "Oh, so beautiful! so beautiful!" was all that she could say. And a tear stole silently down her olive skinned face. The children gathered about the piano and begged for more, and when their mother had partially recovered herself, she too came to Mary and begged with the children, saying, "Oh, dat makka me tinka so much of home in Italy and de leettle baby we lefta buried dere."

All of this deeply touched Mary's sensitive feelings. She sat thoughtfully for a minute, and then she turned and sang several other hymns, familiar to all peasant Italians. Finally she hit upon one which even the children knew, and after a little urging from their mother, they sang it through with Mary, much to the enjoyment of everyone. Then she taught them to sing "Hark, the Herald Angels Sing", and by the time they were called to the dinner table, they were singing as though they had always known it.

To have watched the Nicolettis eat, would be evidence sufficient to demonstrate the merits of the Christmas dinner. But to listen to the noise made by the smacking lips as they closed over full mouths was appreciation supreme for Bob's mother as she moved about quietly from one to the other to see that each plate was well filled. Everybody laughed when Mario announced with a mouth already altogether too full, "Dissa pie so good, why you not makka one likka it, mamma?" as he bit savagely into it.

During the afternoon there was more singing, and apples, pop corn, candy, and nuts enough for ten families like this. The candles on the Christmas tree were lighted while it was being robbed of its gifts. There were dresses for the girls and Mrs. Nicolletti and shoes and mittens for the boys and their father. The mother was too overcome to say much, but her sad, pleading eyes conveyed what she might have said to her husband, for he arose and warmly grasped the hand of Mrs. Ramsay, saying, "We all tanka you so mooch. You and alla de other been sucha gooda angels!"

The presentation of the pure-bred calves was to be held for the last event of the happy day, which was now fast wearing itself into the gray of the evening. Bob had arranged for this and during the afternoon he had slipped out to the barns and harnessed the two sleek Percherons, Jim and Nancy, so as to be ready to take the calves to their new home, where they were to be the foundation of another pure-bred herd.

It didn't take much urging to get the family out to the barns on the pretext to see the Ramsay herd. Even Mrs. Nicolletti consented to go when Mary agreed to remain behind and take care of Caruso. Once inside the stable, Bob didn't wait for them to look over his father's fine cattle. He led them directly to the pen that held the four black and whites that were doomed to leave the best home that ever a calf had.

Bob knew from his knowledge of calves that they wouldn't stand for much ceremony. He lined the four boys up along the wall, saying as he did so, "now you fellows stand right where you are so as not to scare the calves." They obeyed as if they were under military guard, ready to face the firing squad. Then he quickly worked himself in among the calves and shoved the first, a fine young bull toward Antonio, saying, "This is yours, Antonio, Santa left him here for you. And this is yours, Angelo, this one is for you, Pietro, and this for you, Mario," as he pushed the smallest of the four toward him, saying as he did so, "they are yours, boys, and you are to keep them to help build up a good herd of cattle for your father and yourselves."

The three older ones didn't know what to make of it all as they bashfully gazed from one to the other. But not so with Mario. He fell to hugging the little white face that was trying to nibble his chubby fingers, as he gurgled Italian love words to it.

"Oh, you gotta so mooch, Meester Ramsay," broke forth the mother filled with emotion at the sight before her. "We tanka you so beeg," as she spread her arms wide apart to express the bigness of her appreciation. "We gotta nottings to geeve you back."

"I don't want you to give anything," returned Bob as he fastened a warm blanket on each of the calves to protect them during the cold ride which they were about to take, adding as he looked up at the boys, "Santa Claus did all of this."

Then with the help of Antonio, he quickly hitched the powerful team to the sleigh, loaded the calves into its deep straw filled box and together with the three oldest boys dashed out of the yard and up the road toward their home. He returned in time to take the rest of the family, and Mary gladly accepted his invitation to accompany them. And as they drove home in the pale moonlight of the early evening, both agreed that a Christmas spent in making others happy carries its own reward.

Junior Letters

Hoard's Dairyman Juniors:—I am 12 years old and am in the seventh grade. I have lived on a farm for 8 years and like it fine.

We have 27 head of cattle, 15 milk cows, 10 yearlings, 1 little calf a month old, and a pure-bred Jersey bull. Our cows are all dry but one. I like Jersey cows best. I have two cows and the calf. We also have three horses and a pony. The pony is mine. We have 100 acres; 70 are in cultivation and the rest in pasture.

Wishing all the juniors good luck.

Oregon. Robert L. Gibson, Jr.

Hoard's Dairyman Juniors:—I have been going to school every day since our school started. That is one reason why I have not written before. I am in the fifth grade.

My father has joined the cow testing association. The cow tester said we had a good start. One of our best cows tested 6.3%. We are milking eight cows at present. Their names are Rilma, Pancy, Rosey, Reddy, Dayrose, Star, Litsgoo, and Bopeep. Rilma is my cow. We have mostly Guernseys and some Shorthorns but papa wants to sell all of the Shorthorns and get only Guernseys.

The nearest railroad center near my home is Spring Grove. It is eight miles to town.

Well, I guess my letter is getting rather long. I will close. I wish some of the juniors would write to me and I will answer any letter I get. My address is Box 57, Route 3, Spring Grove, Minn. Evelyn Quandahl.

Hoard's Dairyman Juniors:—I received the fob, button, and creed and was very glad to get them.

My brother and I have a rabbit. We have 8 cows, one heifer, and 4 pigs. I am 9 years old and in the 6th grade.

Wisconsin. Richard Delwich.

Hoard's Dairyman Juniors:—My sow gave birth to seven pigs. I am going to join the calf club next year. I hope the juniors will write to me. My address is R. 2, Box 144, Woodstock, Va. David Gochenour.

Do You Belong to the Juniors Club?

If you are a dairy farm boy between ten and eighteen years of age, and if your father or some member of your family is a subscriber to HOARD'S DAIRYMAN, we want you to join the HOARD'S DAIRYMAN Juniors Club.

The Juniors Club consists of several thousand boys like you, banded together to help each other get more pleasure and profit from farm life, and to have the advantage of associating with other boys who live and work and think as you do.

It costs nothing to join the club—and there are no dues. All you need to do to join is just to fill out the coupon and send it to us. We'll at once enroll you as a member and send you a watch fob, a coat lapel button, and the "Dairy Farm Boy's Creed". Do it now—then you'll soon be a full fledged member of the HOARD'S DAIRYMAN Juniors Club.

COUPON

HOARD'S DAIRYMAN Juniors,
Fort Atkinson, Wisconsin.

I want to join your Juniors Club. My father's name is _____.

I am ——— years old and like _____ (name breed) cows best. Send me the watch fob, button, and creed and enroll me as a member.

FRIENDS HOSPITAL, Frankford, Phila., Penn.

When writing advertisers please mention Hoard's Dairyman.

Imports of Dairy Products

The total imports of dairy products for the ten months ending October 31, 1920 and 1919, were as follows:

	1920 Lbs.	1919 Lbs.
Butter	30,642,694	7,528,540
Cheese	12,474,340	6,301,458
Cond. and Evap. milk	21,814,671	14,635,863

The total increase in imports of dairy products amounts to the equivalent of nearly 560 million pounds of whole milk. During this same period, our exports of all dairy products decreased equivalent to one billion pounds of whole milk, making the total slack of imports and exports something over one and one-half billion pounds of whole milk. This is nearly 2% of our total milk products and represents the product of some four hundred thousand average cows in the United States.

JEREY

How Jerseys Grow

TWO Illinois brothers write:—"We started in the Jersey business eight years ago with a few grade cows and a small churn, all of which was bought on borrowed capital. We are now operating a large creamery which churns about 2000 pounds of Jersey butter weekly for the Philadelphia market. In the course of eight years we have increased our herd to 150 Jerseys."

Jerseys breed for profit as surely as they are *"The Profit Breed."* Having one Jersey is enough to want a herd.

In these days of high-cost feed and care, Jerseys are essential because they produce more butterfat from the same amount of feed. In addition, they milk months sooner and years longer than other breeds.

Jerseys will save you many years in building a profitable dairy herd. Our Information Bureau will supply you with the facts.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Scours

1. I want to learn how to raise calves. We are having a great deal of trouble here with young calves. The calves are taken from the dam when 24 hours old. They are then fed the dam's milk at the rate of 3 lbs. twice a day or 2 lbs. three times a day for about two weeks. The milk is then increased ½ lb. provided the calf is alive and well. Meanwhile we attempt to teach the calves to eat a small amount of the following grain mixture: 4 lbs. of each of the following, shelled corn, whole oats, and bran and 1 part of oil meal. They are given mixed clover and timothy hay and oats straw as they learn to eat it. In many cases the calves have a sort of a fit and die in a few hours. I have overcome this largely by a liberal use of castor oil.

2. We recently had three heifers die. These were 6 to 9 months old. These had been getting 4 lbs. of separated milk twice daily. They also received 2 quarts of the above grain mixture and mixed clover and timothy hay and oats straw. We tried to never give them as much hay as they would eat and they often ate their bedding of clean oats straw. They were in excellent condition. The symptoms began with rather violent scouring and then constipation and apparently pain. Castor oil had little effect.

3. Another trouble that we are having here is to get our cows with calves. We have washed the cows with the following solutions: B-K, permanganate of potash, baking soda, and are now using boric acid. We use these 2 or 3 times a week. Please do not tell us to have the local veterinarian. We seem to have exhausted his knowledge on the subject and he lives 20 miles from here. I want to learn, if possible, how to do this myself.

Sparta, Ky. H. G. I.

1. Do not allow calves to chill in cold or wet. Make them drink very slowly and have the milk blood warm. Fast drinking often causes fits. Instead of the ration mentioned allow calves to help themselves to whole oats, with bran and oil meal from a self-feeder. If possible put in a big lump of chalk for the calves to lick. If trouble starts, mix half an ounce of formaldehyde with fifteen and one-half ounces of freshly boiled water and add a teaspoonful of this mixture to each pint of milk fed. Limewater is useful in the same way, but allow one ounce per pint of milk. If other treatment is necessary give a dose of castor oil in milk and then triple sulpho-carbolate tablets in a little water every three or four hours. The dose of tablets is from 15 to 30 grains each time. Pneumonia sometimes is associated with the most fatal forms of scours and may be prevented or treated with a special biologic. Consult your veterinarian about that.

2. Sudden change of feed would be a likely cause of scouring in these cases.

3. The articles referred to exactly cover these cases, for you may be sure that endo-metritis is present and the infection with the germs of the abortion disease is the likely cause. Flushing out of the vagina will not suffice. It is absolutely necessary in all such cases to treat the womb and for that a trained expert must be employed. He may be able to instruct you how to do the work, but that rarely is successful.

Impotent Bull

Please inform me as to what kind of reaction I can use on my Guernsey bull, 7 years of age. He is very slow at serving and refuses some altogether. He is penned where he can see the herd. At present I am feeding 4 qts. of ground oats, 30 qts. corn and soy bean silage. Hay is the second cutting of timothy. I can get most any kind of feed and will do anything to make him serve.

McLean, Va. B. H. W.

Get the bull out of that pen and make him work daily in a treadpower or harness, or at least turn him loose in a paddock where he can butt at a big, smooth stump or block of wood suspended by chains from an overhead beam. Abortion disease infection is not the cause of the bull's indifference, nor would the journey cause such an effect. Lack of exercise is the chief cause and we should advise you to stop feeding silage and timothy hay and substitute clover or alfalfa hay and a ration of oats, bran, and oil meal.

Breeding Query

I have a young cow, 2½ years old, that had her first calf in April, 1920. As she was only 24 months old at that time I gave her 5 months rest before breeding her again. I took her to our bull November 3 with the intention of having her bred. Today, November 24, she is in heat again and again she is with the bull. She is very much in heat but does not let the bull serve her. I am leaving her with the bull all day, hoping that thus she may take the bull yet. The bull was fed grain until one year old. After that I stopped the grain and am keeping him now on alfalfa only. By such a light service is alfalfa not sufficient to keep him in good shape and to aid his development sufficiently?

New Me... R. C. P.

Never allow a bull to run all day or half a day with a cow when she is in heat. One service is sufficient at each period of heat. Service should be allowed as soon as the cow is seen to be in heat. You probably let the cow go too long before trying her with the bull. It is dangerous to let a well fed cow to go five months unbred. An all alfalfa ration is too loosening and irritating for a bull. It may help to induce impotency. Feed other roughage with alfalfa and also allow bran, oil meal, and ground grain. More services would be good for the bull, if he is properly fed and actively exercised every day. Before having the cow bred again syringe out her vagina daily with lukewarm water containing a heaping teaspoonful of table salt to the quart. Injection may have prevented infection.

Sore Teats

I have a small herd of pure-bred Guernseys and am having trouble with their udders becoming sore. I notice they have caked up between the teats and finally form a scab; also the teats seem to do the same thing.

Salisbury, Md. J. E. S.

Chapping from cold after wetting of the teats with filth from stall floors or yards may cause such conditions, if you are sure it is not ringworm. Bathe the parts twice daily with hot water containing all the boric acid it will dissolve; then dry gently and apply benzoated oxide of zinc ointment. If that does not suffice stop the bathing and rub in a little iodin ointment twice daily and if that is not effectual substitute 10 per cent oleate of mercury. The latter must be washed off before milking. Remove causes mentioned.

Rash—Lice

1. Some of my cows have a scabby rash on the upper part of their udders. We thought it was cowpox, but seem unable to get rid of it. What is it and what is the remedy?

2. What do you advise using for small gray lice on cattle?

Standish, Mich. M. O.

1. Cowpox mostly affects the teats and causes oval sores which scab over and then form pits or pocks which remain for some time. New crops of pustules break out now and then, so that the disease remains for some time. It has to run its course. For a condition such as you describe we think benzoated oxide of zinc ointment would be appropriate after bathing with hot water containing all the boric acid it will dissolve. Keep stall floor clean. Milk with clean, dry hands.

2. Groom cattle with a hard brush dipped in raw linseed oil as often as found necessary, or use a solution of coal tar dip made according to directions given by the manufacturer. Rid the stable of lice by cleansing, disinfecting, and whitewashing.

GUERNSEYS

Harbor Hill Guernseys
Masher's Galore 8572 A. R.
Increased the Average Production Credit of 12 A. R. daughters out of A. R. dams by 181 lbs. We offer his double grandson out of another daughter also making a better record than her dam.

King Oak Segis Pontiac
Our Herd Sire

A Herd Cannot be Better Than Its Sire

You can put green goggles on a cow and feed her sawdust. It's cheaper, of course, but will the cow give milk?

It's the same way with a herd sire. A poor one will probably sire just as many cattle, but what will they amount too?

If you intend to get anywhere raising Holsteins, you must use the best sire that money can buy.

We had this in mind when we bought King Oak Segis Pontiac and his full brother, Oak Dale Segis Pontiac. But there was one other reason why we bought these two great bulls. They carried the blood lines we wanted.

There are five strains of Holsteins that look pretty good to us and quite a number of our fellow breeders. They are so good in fact that we have decided to affect a combination of all of them.

Our foundation dams were selected with this in mind and now with the help of our wonderful Herd Sire, King Oak Segis Pontiac, assisted by his full brother, Oak Dale Segis Pontiac, we are well under way with our great work.

We have a few foundation cows and young sires for sale which might interest you. Write us or, better still, come and see our herd and let us tell you more about the great work we are doing.

First State Sale

ROCHESTER, N.Y.
JAN. 12-13
1921

Buy From New York's Best
Guaranteed Under Retest
Every Animal Individually Selected

A competent judge has spent more than six weeks in the selection of these animals from 60 leading herds.

Every animal over 6 months of age tuberculin tested with subcutaneous, intradermal and ophthalmic test and guaranteed under the 60-day retest.

Every animal of breeding age is recently fresh or will freshen at time of sale or is heavy in calf.

This sale, made possible by the united efforts of more than half a hundred of New York State breeders will bring together what will undoubtedly be as choice an individual collection of Holsteins as has been offered in public sale.

They invariably "turned over" their herds and allowed the choice of as many animals as the selection committee believed would maintain the high ideals established at the outset. With so wide an opportunity, it has been possible to select animals that could not ordinarily be purchased at any price—animals that are perfect in point of individual quality, have the very best of breeding and are free from every disease—just the sort of animals that ought to appeal to discriminating buyers. A brief review of the entries shows the following are entered:

Two handsome 30-lb. cows in calf to a son of a 42-lb. cow.
A 34-lb. 4-year-old with a year record of better than 700 lbs. as a 3-year-old.
A daughter of a 32-lb. cow in calf to a grandson of May Echo Sylvia.
A young bull backed by two generations of 31-lb. and 600-lb. cows.
A 27-lb. daughter of a 32-lb. cow due at sale time.
A 36-lb. cow with better than 760 lbs. milk also with splendid yearly record.
A 27-lb. daughter (646 lbs. milk) of a 36-lb. cow with 700 lbs. milk.
The Grand Champion cow at the New York State Fair and her daughter.
A Spring Farm King Daughter from a 30-lb. daughter of a 36-lb. cow.
A 26-lb. 2-year-old granddaughter of a 36-lb. cow.
10 COWS ABOVE 30 LBS. BUTTER

A son of the youngest heifer in the world with 30-lb. records.
A young daughter of King of the Pontiacs from a 30-lb. dam in calf to a 36-lb. sire.
The highest record daughter (34-lb.) of Sir Prilly Segis bred to a son of the New York State Champion.
A 31-lb. 3-year-old in calf to a son of a 30-lb. cow.
A son of a cow that has twice made better than 30 lbs. as a 3-year-old.
A 26-lb. daughter of the world champion 44-lb. 4-year-old.
A 27-lb. daughter of the only six times 30-lb. cow.
A young son of Ormsby Korndyke Lad from a high record dam.
A 35-lb. daughter of a 32-lb. cow.
A May Echo Sylvia granddaughter from a 27-lb. yearling.
25 FROM 30-LB. DAMS

The above is not to be taken as a complete list of the "stars" in the sale. Since the animals have been chosen from so many herds, many of them supporting different strains, there will be found in this sale daughters of practically every great sire in the east. It is a sale of the type so rarely held and thus one which high class breeders should not overlook attending.

The sale will be held on the Rochester Exposition grounds January 12th and 13th — the two days immediately following the annual meeting of the New York Holstein-Friesian Association. The cattle chosen for this annual event are truly representative of New York's best. Catalogue will be ready for the mails January 1st and will be sent only to those making inquiry for it.

Special Bull Offer!

Ear Tag 1094

Study the Production that Backs Him:

His Sire's Sister was Grand Champion at the Pacific International Exposition, and has just broken the world's record for her age.

His Dam produced 604.7 lbs. of milk in seven days.

His Sire's Sire has 140 daughters in our herd, among them three who hold records for their age, and ten champions of America's largest shows.

His Dam's Sire has a daughter who holds the butter production record for thirty days in the United States, also a number of 30-pound four-year-old daughters.

His Sire's Grandsire is the sire of the only cow who ever averaged 100 pounds of milk a day for 365 days.

His Dam is by a Grandson of COLANTHA 4TH JOHANNA who produced 1247.8 pounds of butter in 365 days.

We will guarantee this bull free from any disease and a breeder, and when he gets to you if you are not satisfied you can return him at once at our expense.

Price $600

2 Of My Sons Are For Sale

RAG APPLE PONTIAC

They are full brothers, one 18 months old, the other 8 months old. Both are first class individuals, nicely marked and very well grown.

Their dam is one of the best producers in the herd and has a 7-day record of 26.96 lbs. butter.

I am Rag Apple Pontiac. My dam is a 30-lb. daughter of King of the Pontiacs and I trace several times to Pontiac Korndyke.

There are a few other high class sons of mine for sale here.

Several A. R. O. Cows and some good heifers are for sale. The cows' records run up to 72 lbs. My boss is offering these females and young bulls at bargain prices because he needs the room. Better write him today. He is

W. W. Quackenbush - West Salem, Wis.

Remember—

When You Buy A Bull From Hollyhock Farms

You Have Our Entire Organization Back of You. You have the benefit of our advertising and of our test fores. The chances are far better than even that the dam of the bull you buy will later increase her record and the bull increase in value. Consider those things when you want a bull and write us about a son of S. P. O. M. 41st or of King Pontiac Artis Sadie Vale, the 34-lb. son of K. K. S. V. that formerly headed our herd.

We have a few good ones for sale—1 or 2 of serviceable age.

Gustave Pabst's Hollyhock Farms

Fred J. Southcott, Manager **Dousman, Wisconsin**

Mr. Holstein Breeder—

You are Invited to

Pinehurst Farms

at any and all times. Come if you want a herd sire or foundation females. Come if you don't want to buy. We believe you will be interested in Sir Ormsby Beauty Pontiac Segis and his get and in our herd of producing females, many of them now doing very well on 7-day and year test.

You will be welcome and remember if you should buy from us, we stand back of every animal sold.

Pinehurst Farms Co., Sheboygan Falls, Wis.

Cows and Heifers

A Few Good Bulls

Because I am overstocked, I am offering some very good registered females for sale. They either have A. R. O. records or are from A. R. O. dams.

Can also offer some excellent young bulls by a 33-lb. sire and from A. R. O. dams with records up to 28 lbs.

Every animal sold is guaranteed to be as represented.

Write or come and see for yourself.

J. D. McDonald West Salem, Wis.

If you knew of a way to put money in your pocket you'd take advantage of it, would'nt you? Well there is a way.

BOOST

Boost this Holstein-Friesian game — the biggest business on earth.

Naturally we have felt the pressure of these abnormal times of readjustment after the war—what business has not—but we have a business that has weathered the storm better than any other.

The Holstein cow has not been affected—she has gone right on milking, making her yearly contribution in the way of a splendid calf—and paying a handsome profit.

What other business on the face of the globe can make the same showing?

Concerns holding large stocks of merchandise are practically paralyzed, so far as active business is concerned because of the slump in values. A stock of merchandise lying on a shelf does not produce any income.

Is that true of the Holstein cow? It is not. She goes right along producing her tremendous amount of milk daily—to say nothing of her calves.

If men in other lines of business had as much to brag about as we have — they would do limitless advertising.

What we need in this Holstein game is boosters.

We're Boosters. Are you?

Just About Ready for Service — $500

(Federal Accredited Herd)

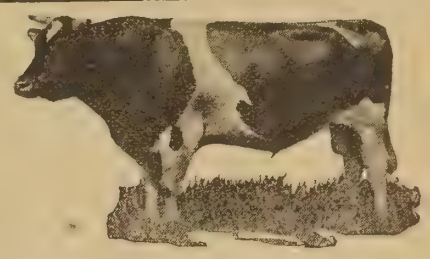
is this bull we offer, and individually as good as his sire, Sir Walker Segis Homestead, first prize yearling bull at Chicago and Waterloo, 1919.

His dam just finished 305-day test with over 12,000 lbs. milk and 500 lbs. butter (2 milkings daily) as junior two-year-old and is a show heifer, first prize two-year-old and champion female at Minnesota's largest county fair and Holstein show (175 head).

Send for pedigree and photo.

A. J. Lashbrook, Northfield, Minn.

Lola Segis Pontiac Homestead



the highest record bull in southern Minnesota, heads our herd. His sire, Piebe Laura Ollie Homestead King, has more daughters that as 2-yr.-olds have produced 20,000 lbs. milk in a year than any other. His dam, a 34-lb. 4-year-old daughter of King Segis Pontiac Count, has 3 records averaging 33 lbs. and has made over 1,000 lbs. in 1 year. We have a few serviceable bulls and younger from A. R. O. dams for sale.

Clover Lea Farm, W. W. Walker, Owner. Austin, Minnesota

Serviceable Sons of "Piebe"

are for sale. We have several from well bred, good, year record cows, cows with records up to 1,100 lbs.

Piebe Laura Ollie Homestead King is the phenomenal present day sire with 7 daughters that average over 20,000 lbs. milk as 2-year-olds. He is a show bull as well and his sons and daughters have been winning at the shows this fall.

Better write us at once or, better still, come and see us.

MINNESOTA HOLSTEIN CO., V. S. Culver, Sec'y & Mgr., Austin, Minn.

Bull Calves of Ormsby Breeding

from A. R. O. dams for sale, 2 to 8 months old. Prices $200 to $1,000. We can also offer several good, typy cows bred to a good Ormsby bull. Write or come and see us.

MINFRAL SPRINGS STOCK FARM, - - SAVAGE, MINNESOTA
Stuart—McIntyre—Hansen, Owners.

Address correspondence to Axel Hansen, formerly with John B. Irwin.

Serviceable Sons of Dutchland Aaggie Tidy Prince

I have three of these youngsters for sale, all ready for service and from A. R. O. granddaughters of S. P. O. M. Their sire is from a sister to Tidy Abbekerk Prince and already has a good list of tested daughters, including one above 36 lbs.

Write today for complete information.

E. J. BROSIOUS, - - Stillwater, Minn.

Hitch Your Wagon

to a STAR. If you want the blood of King Segis Pontiac Count and haven't the money to get a son, investigate King Segis Pontiac Fayne Star, "The best individual King Segis Pontiac Count ever sired." Our bull circular is stamped. We are waiting for your address.

Flecks Farms, Faribault, Minn.

Sir Korndyke Ormsby De Kol 15th—21 Months Old

His sire is a son of Sir Korndyke Hengerveld De Kol; 51 A. R. O. daughters. one of whom has a 7-day record of 39.56 lbs. and several above 1000 lbs.

His dam has a record of 23.778 lbs. and now on yearly test.

Geo. H. Elwell, - Minneapolis, Minn

Grandsons of Sir Pietertje Ormsby Mercedes

The sire is Sir Pietertje Ormsby Mercedes 22d, a son of Minnesota's first 1000-lb. cow. These bulls are all nicely marked, straight top lines. Very good individuals from good A. R. O. dams.

For pedigrees and prices, write

O. J. GROVER, - GLYNDON, MINN.

Grandsons of S. P. O. M. 41st and a Few Good Cows For Sale

The cows either have A. R. O. records or are from tested dams, and are in calf to my herd sire, a son of S. P. O. M. 41st. The young bulls are from A. R. O. dams.

Herd under state and federal supervision. Write for complete information to

V. R. HOLMES, - ANOKA, MINN

Grandsons of

Duchess Skylark Ormsby and of S. P. O. M. 38th.

for sale. These youngsters are from A. R. O. dams that are now making good yearly records. Write today for further information.

POPLAR HOLLOW STOCK FARM,
Bertram D. Scott, Prop., Hotel Hastings
Minneapolis, Minn.

Lake Shore Holsteins

40 pure-bred heifer calves, 6 months to one year, $150 to $200 this month. Good type, good backing.

E. J. Oppliger, Forest Lake, Minn.

COME TO BISCAY

for your next purchase of pure-bred or grade Holstein cattle, mature or young stock. Large selection, also a few select male calves to offer. Located near station.

BISCAY SALES CO., BISCAY, MINN.

Mankato Holstein Farms

Our Herd Bulls

King Colantha Ormsby Bess, A Sir Pietertje-Bess Burke combination. Nine dams average over 1,000 lbs.

A son of Ormsby Korndyke Lad. Ten daughters over 1,000 lbs. butter, eleven over 22,000 lbs. of milk.

A son of Sir Pietertje Ormsby Mercedes 14th, that great transmitting show sire.

Both Males and Females For Sale

Marlow & Randall, Mankato, Minn.
(*A Federal Accredited Herd*)

MONEY

Is Hard to Get. So Are the Right Kind of Bulls!

We have both. Don't go without the bull you need just because money is tight. LET US HELP YOU. We also have a few females. WRITE FOR OUR BARGAIN LIST AND PAYMENT PLAN. Every milking animal in our herd has an official record. We need the barn room. Take advantage of this opportunity. SATISFACTION GUARANTEED.

GRAHAMHOLM FARMS, Holstein-Friesians
Federally Accredited.

H. R. Searles, Mgr., Rochester, Minn.

For Sale

A Few Good Females

Several High Class Young Bulls

I have a few good ones left. Write me at once if you are in the market for a herd sire or a few foundation females.

CHAS. OBY, Maple Lake, Minn.

RICHLY BRED

HOLSTEIN BULL CALVES

out of A. R. dams and sired by our two richly bred herd sires — **King Piebe Ormsby Mercedes,** a 35-lb. son of Sir Korndyke Bess and every dam in pedigree over 22 lbs. and **King Pietertje Mercedes Ormsby,** a son of Sir Pietertje Ormsby Mercedes and out of a 19-lb. senior two-year-old dam.

Herd tuberculin tested. Write for information or visit herd.

P. FROST SPAULDING FARM CO.
C. L. Spaulding, Mgr., Warren, Minn.

Sir Ormsby Segis Korndyke

grandson of Pietertje Maid Ormsby on sire's side and from a good daughter of King Segis Pontiac Count, heads our herd. Our bulls are all sold but we will book orders for future delivery. We have a few good high grade cows and heifers for sale for cash or on time.

ISLAND PARK STOCK FARM,
Hanscom & Anderson, Props.,
R. F. D. No. 1, St. Cloud, Minn.

Grandsons of "Piebe"

We have for sale a few 5-8 months old sons of Lola Segis Pontiac Homestead, he a 34-lb., 1,000-lb. son of Piebe Laura Ollie Homestead King. Most of them are from good producing daughters of Joe Oak De Kol Fobes, a grandson of Homestead Junior De Kol. Price $125 to $250.

Write us at once if you want one.

RANDALL BROS. Lakeland, Minn.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

Make Your Cows Happy- And They Will Give More Milk

It is Christmas — what better gift for faithful, ever working cows than James drinking cups?

Cold weather thirst—the great thief of the winter milk pail—vanishes completely when James drinking cups are installed.

With James cups, your cows can drink whenever they like, as much as they like, at the temperature of water they like, any minute of the day or night.

No More Icy Water

There is no more going thirsty three-quarters of the time—no more herding the cows out to drink and herding them in again—no more frozen tanks to chop open—no more day-after-day, body-freezing, wind-biting, winter chore to worry about in watering your herd. James drinking cups put an end to all this, once and for good.

Hundreds of dairymen have found out that they were not giving their cows enough water to drink.

When they installed James cups, the amount of milk received from the herd increased suddenly.

But there was no magic about it.

It was simply the natural consequence of following out natural laws.

Just as too little feed means too little milk; so not enough water cuts down milk yields.

Proven by Milk Records

An investigation was made in 28 herds (759 cows) where milk records were kept. One herd showed an increase of from 5 up to as high as 10 lbs. per cow, per day, just as a result of giving the cows all the water they wanted whenthey wanted it.

Four herds reported an average increase of 4 lbs. per cow, per day; three stated 3 lbs.; five showed 2 lbs., three 1½ lbs.; one ¾ lbs.; one reported an increase in milk yield valued at $8.56 per cow, per year; one averaged $5; one $10; one received 3% increase; one 8%; two 10%; one 12½%; one 20%; one 33⅓%; and only one herd out of the 28 found that the increase was "not much." An average increase per cow per day of 2.45 lbs.

And now you ask yourself the question, "Can I afford James Cups in my barn?" "Would it not be better to wait until next year?"

You Lose by Waiting

The plain fact is that if next year some one were to make you a gift of the James cups, you would lose money by waiting.

Two pounds milk per cow per day, for the 200 days the cows are in the barn, means 400 lbs. of milk, which at $3 per cwt. is a total of $12 for the season.

In these days when feed and other costs are high, can you afford to neglect this extra profit?

Don't put off this drinking cup proposition. Write us at once for a definite price estimate covering a drinking cup installation in your barn.

Barn Book Free

If you are interested in other labor saving equipment for the dairy barn such as cow stalls, carriers, steel pens, ventilators, etc., or if you are interested in up-to-the-minute ideas in the planning of the new barn, ask also for our big barn building and barn equipment book "The Jamesway No. 23".

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

A unique bonus has recently been offered to the dairymen of Effingham County, Illinois. H. J. Rucker, the farm adviser, has been promoting the tuberculin test in this county for some time, and, in conference with the milk buyers, he obtained a bonus of ten cents per hundred pounds of milk produced from a tuberculosis-free herd, under federal supervision.

This is the same Southern Illinois county that recently signed 17 members to the State Holstein-Friesian Association, and which took first prize with a Holstein County herd at the Illinois State Fair. T. R. LOVETT.

Indiana Dairymen Will Meet at Lafayette

The annual meeting of the Indiana State Dairy Association will be held at Purdue University, Lafayette, Thursday, January 13, 1921. A program of unusual value to the dairymen of the state and in keeping with the new problems of the dairymen is being prepared and everyone interested in the dairy business should make an effort to be present.

On the following day, January 14th, the State Dairy Breed Associations will hold their annual meetings. This will enable the breeders of dairy cattle to attend the two conventions as well as to attend the sessions of the annual Purdue short courses held during this week. It should be an unusual round-up of dairymen. Special plans are being made for a dairymen's banquet on Thursday evening and the committee in charge of the program is anxious that the dairymen will bring their wives to this convention. They can attend the dairy association program, the Indiana Home Economics Association meetings or the women's sessions of the farmers' short courses. A detailed program of the meetings will be issued and copy of same can be secured by writing C. R. George, Secretary, Lafayette, Indiana.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

The Finer Purpose

The New Year dawns with hopes held high,
And visions spreading o'er the sky.
Once more we say: "A better year,
A nobler voice for God to hear."
The purging thought—the wish to do,
Brings faith a little nearer you.

If we but want to mend our ways,
Some subtle sense the wish obeys.
Religion rests in strong desire,
Although we may be tried by fire.
Each new resolve—each sweeter thought,
By wireless stations soon are caught.

The love we bear for those around—
The reverence for seed and ground—
The cleaner challenge of the soul—
These represent a higher goal.
The slate is clean—the year is new,
Let's plan for finer things to do!

Dairy Joe's Philosophy

Every time I draw up a set of New Year's resolutions, some fool cow kicks over the bucket and makes me cuss or a hired hand neglects his work and causes me to mistrust mankind.

I have changed my plan of operation this New Year—I'll resolve not to break the resolution that I made last year—and broke.

I've promised myself, beginning January 1st, that I'll not question judges at county fairs when they give the other fellow the blue ribbon—but I can't help but think my cows ought to come in first, just the same.

A New Breed

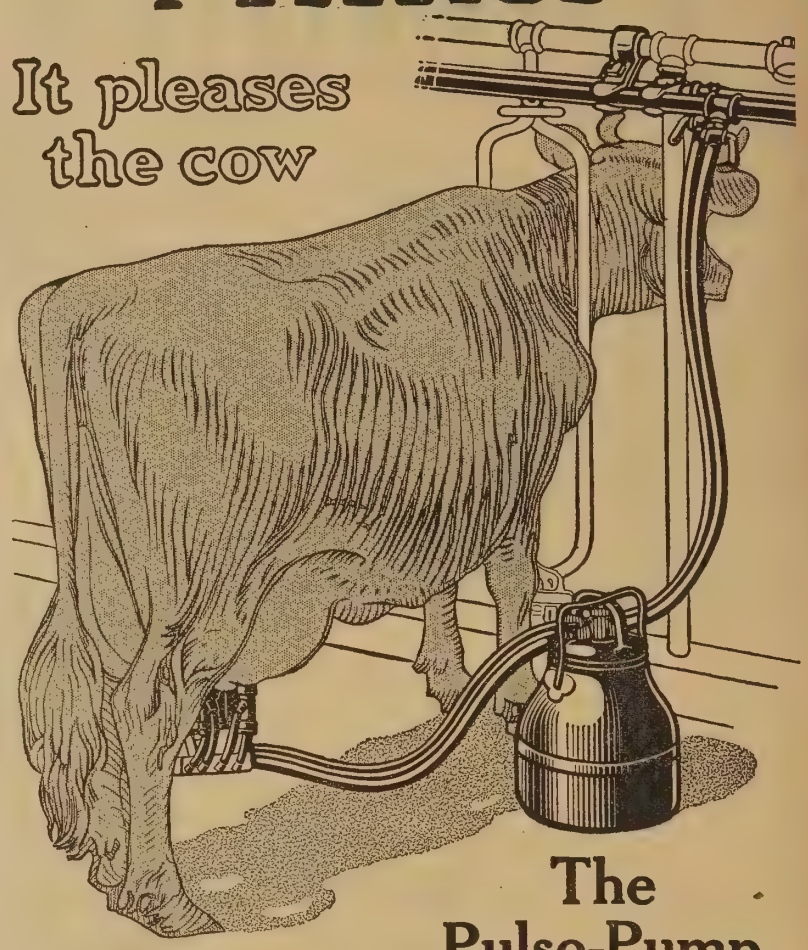
"Had lots of folks spending the holidays with you this year, didn't you? City folks? Have enough turkey to go round?"

"Yep. But there is one thing sure; I'll have to find a new breed of bird that is breast all over and white meat in the wings."

Resolutions

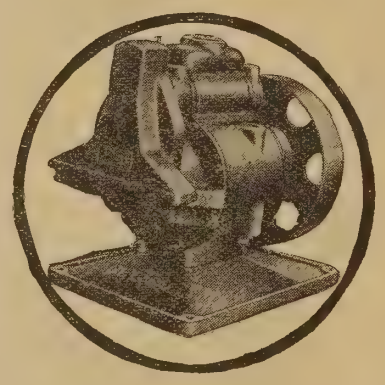
The feeling of remorse.
The writing down of new resolutions.
The resolve not to smoke a pipe.
The promise not to scold the boy.
The sense of satisfaction.
The lost carried around in a vest pocket.
The boasts you make to the wife.
The first day you keep 'em all.
The second day—but getting harder.
The third day—hungry for the pipe.
The fourth day—a sneaky smoke back of the barn.
The argument with yourself about it.
The scolding of the boy because he failed to cut that stove wood.
The lost list.
The resolve to start all over again next year.

If You'll Stay Here



Boy, I'll give you acreage,
Seeds to plant it with, and all,
Pick your tractor from the page,
There'll be harvests in the fall.
Out there, yonder, on the hill,
Is a pasture, fair and fine.
For your herd—a cow or two,
Just as pedigreed as mine.

Calves? Of course, a pair of them,
Take your pick—and of the best.
That brown youngster is a gem!
Take another from th' rest.
In the barn your own, fine stalls,
Bags o' feed and everything,
It's the heart of me that calls!
But I want you in th' spring.



Motor car and three nights off
Just to see th' picture shows.
There's a new road, building, son,
For th' comin' of your beaus.
Best of all—a mother's love
Mixed with mine, is waiting here.
And a good-night kiss for you
When th' trouble times are near.

The De Laval Milker

It pleases the cow

The Pulso-Pump

(The Pulso-Pump is not shown in the part of the Milker installation pictured above. It is connected with the power in any convenient part of the barn)

The De Laval Pulso-Pump produces the vacuum which draws the milk from the cows, and it also controls the action of every Udder Pulsator.

This combination in one unit of the vacuum-producing and pulsation-controlling features of the Pulso-Pump is a decided forward step in milking machine construction.

The mechanism of the Pulso-Pump is entirely housed in to keep the oil in and the dirt out; it runs in oil, evenly and quietly.

The Pulso-Pump is built with Hyatt roller bearings and the construction throughout is such as to insure uninterrupted and satisfactory service without the need of adjustments or attention, other than the addition of oil about once a week.

The De Laval Milker is a distinctly different type of milking machine. It is alternating, positive, uniform and gentle in action — and requires no adjustment of any kind. It is faster, more reliable and more sanitary than any other method of milking.

The De Laval Milker is sold with full knowledge of the fact that more is expected of it than of any other milker — due to the Company's reputation for service and satisfaction to users of De Laval machinery.

Write to nearest De Laval office for Milker Catalog, mentioning number of cows milked

Improvement Comes Through Co-operation

Ed. Nordman

ED. NORDMAN

UNREST from our economic evils is general. The complaints which are heard from all sides are the best signs of the discontent which prevails in society. They come from almost every group. Farmers complain that they do not get the right compensation for their products—consumers, that they pay too high prices for these products.

This disagreeable situation has become worse during the last few weeks. The prices on some farm products have dropped so low that farmers have decided to hold their products rather than to sell them at a loss. On the other hand, the consumers generally have not felt to the same extent this fall in prices. This situation seems to be bewildering, to say the least. And it forbodes many hardships both to producers and consumers.

To alleviate this state of things many remedies have been proposed. It is impossible, however, in this article to enumerate all of them. The people who propose them belong to either of the two following groups—those who believe that action by the federal or state government can remedy the situation or those who consider that the only remedy is to be found in the pressure of the people themselves.

A study of the economic history of America during the last few years shows that neither of these factors alone can remedy the present abnormal situation. The only worth-while results can be obtained by a combination of these two factors. Both the federal and state governments can do a great deal by passing suitable laws and devising various systems to enforce them. But laws, no matter how well devised to meet a situation, will not be effective unless they have the support of the people themselves. And even this support cannot be effective unless it is expressed through organization.

The whole secret of the disadvantageous position which the farmers occupy in respect to the business men with whom they deal is that they are not sufficiently organized. It is because of this that they are unable to keep watch and thus prevent the passage of laws unfair to them and it is because of a lack of concentrated organized effort that they are unable to exercise the necessary pressure to have favorable laws and decisions enforced.

There is only one form of organization which will benefit the farmers and that is co-operation which is an association on equal and equitable terms of persons for their common benefit.

When Farmers Co-operate

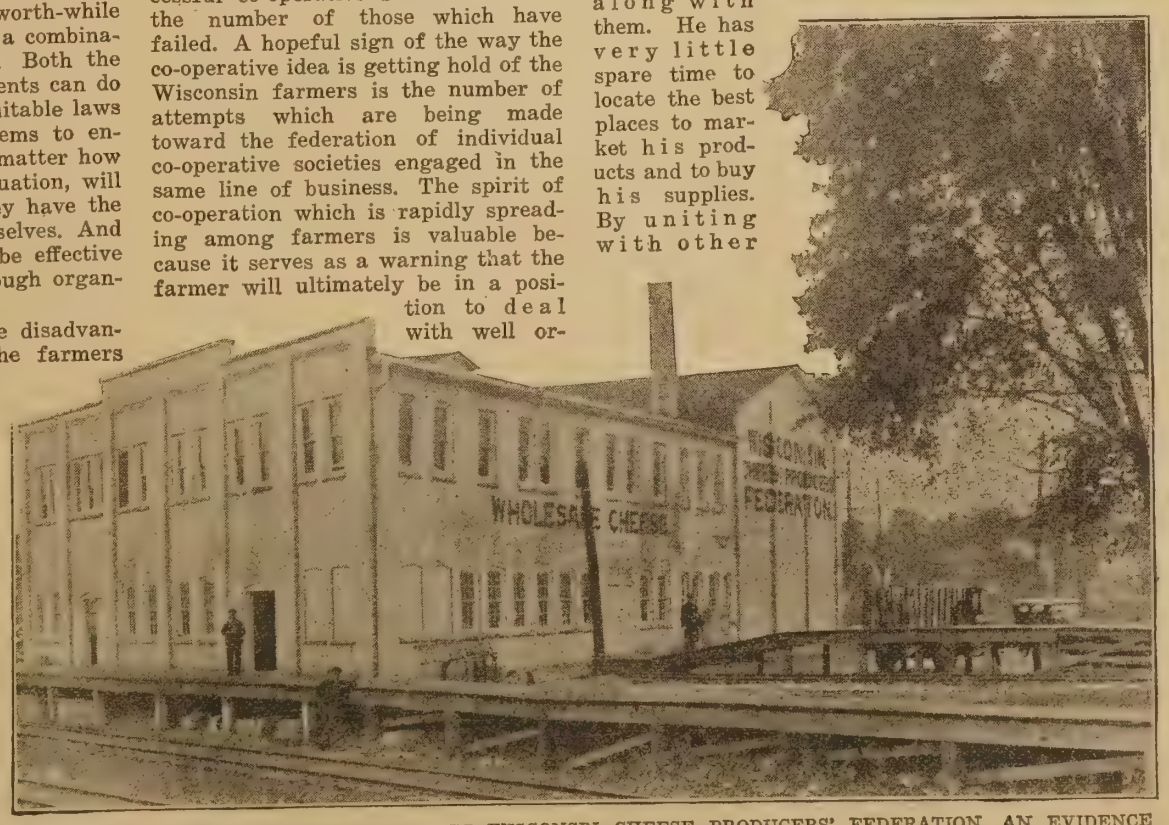
Co-operation among farmers in Wisconsin is not a recent event. Farmers begin to co-operate when they feel that they do not get large enough returns for their products or when they have to pay exorbitant prices for the supplies they need. The feeling of a need for co-operation in Wisconsin began shortly after the Civil war and co-operative enterprises began to appear during the days of the granger movement. But up to quite recent times co-operative efforts on a large scale in Wisconsin were marked by a number of failures. Farmers had to learn how to co-operate. They had to learn that co-operation can succeed only when certain conditions are present. Co-operative societies must grow from smaller to larger units. They must be formed by farmers living in the same community and who have identical interests. Co-operation, moreover, to be successful must be undertaken first in a field where there is no competition from a powerfully organized monopoly. And, above all, a co-operative society ought to be truly co-operative, which means that the value of shares held by one stockholder should be limited to a certain amount and that each stockholder should have only one vote notwithstanding the total amount of his shares.

There are many signs that co-operation is making headway among Wisconsin farmers. The number of successful co-operative societies exceeds the number of those which have failed. A hopeful sign of the way the co-operative idea is getting hold of the Wisconsin farmers is the number of attempts which are being made toward the federation of individual co-operative societies engaged in the same line of business. The spirit of co-operation which is rapidly spreading among farmers is valuable because it serves as a warning that the farmer will ultimately be in a position to deal with well organized business through effective associations of fellow farmers. The result will be that the bargaining power of the individual farmer will increase and he will be able to treat with the business men on equal terms. Outside of the increase in the bargaining power there are other and important advantages which result from co-operation. Co-operation enables the farmer to put the business activities of his farm on a basis similar to that of a large scale business. The needs of the individual farmer for supplies are relatively small. By combining his orders with those of other farmers he is in a position to place orders for supplies in large quantities and thereby obtain better prices. Co-operative marketing, on the other hand, by making possible large shipments reduces proportionally the expenses incidental to individual marketing.

Value of Co-operating

Co-operation is, moreover, of inestimable value in improving the business methods of farming. The individual farmer does not have much time to devote to the business side of the management of his farm. He is tied to his farm much more than the manufacturer to his plant. Because of the standardized system of production in the urban industries the manufacturer can afford to leave the management of his plant to foremen and managers and is in a position to devote the greater part of his time to the business and financial phases of his enterprise. The farmer, on the other hand, cannot leave the management of his farm to his hired men. Not only must he closely supervise his men but he must dig in and work along with them. He has very little spare time to locate the best places to market his products and to buy his supplies. By uniting with other farmers he is in a position to hire a competent man to handle his products, one who is responsible to the co-operative association of which he is a member. This manager can keep in touch with the fluctuations in prices, can find the best market, and in general can find buyers who will offer the highest prices.

From what has been said above, it is clear that the hope of the farmer for fair and just returns on his products is in co-operation. By co-operating, farmers are in a position to deal as equals with organized business, they are able to reduce the cost of production by obtaining supplies at low rates, they will reduce the cost of operation in marketing and they will be in a position to locate the best markets for their products.



Co-operation works, then, towards the improvement of the economic position of the farmer. The next problem to be considered is how to improve the position of the consumer.

The general opinion seems to be that the interests of the farmers and consumers are antagonistic. When consumers pay high prices for farm products they are apt to lay the blame on the farmer thinking that the full price goes to him. As a matter of fact, however, the high prices paid by the consumer do not necessarily mean correspondingly high prices for the farmer.

Commodities cannot be transferred directly from the producer to the consumer. There must be certain agencies whose business it is to transfer these commodities. These agencies are known under the name of "middlemen" and they are an indispensable part of the distributive system. And so far as these agencies work efficiently and receive a remuneration commensurate with their services, they are of real value to society. There are, however, in many branches of distribution more middlemen than are necessary for the transfer of commodities from producer to consumer. In other words, there is a duplication of services. These unnecessary middlemen represent an unnecessary expense which is charged to the price the consumer pays and deducted from the price the farmer receives.

The discrepancy, between the producer's price and the consumer's price is due, however, to a very considerable extent, to the arbitrary fixing of

(Continued on page 1038)

WAREHOUSE AND COLD STORAGE OF THE WISCONSIN CHEESE PRODUCERS' FEDERATION, AN EVIDENCE OF PROGRESSIVE CO-OPERATION

The American Farm Bureau Federation

J. R. Howard, President

J. R. HOWARD

WHEN a national organization of any group or class of individuals leaps into existence almost over night and in less than a year's time gathers to itself a high grade, paid-up membership of over a million members, with state organizations in thirty-three states, it usually means one or both of two things; either there is a tremendous need for that organization or there is a tremendous driving force pushing it along. Since no "driving" tactics have been used in connection with the organization of the American Farm Bureau Federation, I believe it is fair to conclude that there has been and is today a tremendous demand and need for such an organization as the founders of the A. F. B. F. visualized.

All have united to make this organization a huge success. The farm press has been particularly liberal and untiring in its efforts, the various state agricultural colleges and experiment stations, the U. S. Department of Agriculture, and even other farm organizations have all gotten behind the idea embodied in the A. F. B. F. and have pushed it to the front. Even the general public has been quick to accept the idea of a great national organization of farmers with strong, centralized authority.

But, of course, the growth of the A. F. B. F. has not been quite so startlingly rapid and spontaneous as might appear at first glance. We must remember that many of the state units which make up the present national organization have been in existence for several years and that the county units which make up the state organizations have in some instances been in active operation for from five to eight years. In fact, it is this method of organization, growing from the county units to the state units and from the state units to the national unit, rather than vice versa, which we count the greatest strength of the organization. It is a natural movement from the ground up rather than from the top down.

But what do the members who have so readily put up their money and so willingly given of their time look to the organization to do for them? What is it that they expect the American Farm Bureau Federation to accomplish?

Undoubtedly they look to the A. F. B. F. to lead the way in the curing of their economic, legislative, and social ills. This was the idea firmly imbedded in the minds of that group of earnest, forward-looking farmers who met in Chicago in November of last year and laid the foundation principles—and this is the idea no less vividly in the minds of the individual farmer who signs up his three-year or life membership and pays at the rate of $5 to $15 per year. To their minds the A. F. B. F. is not to be a mere debating society, but a thing alive and vibrant with action—an instrument with which to reshape and carve out the destinies of agriculture on a higher plane and scope.

And this is the central idea that has dominated and influenced the every act of the officers and executive committee of the American Farm Bureau Federation. We have tried to keep in mind that we are building permanently—building for next year and the year after and for all time. Rather than make a hasty decision or take a hasty step which might reflect discredit to the organization, we have preferred to proceed slowly, making certain that each step is right. On that foundation alone can we build a structure that will stand and endure.

Tackling the Marketing Problem

But with all our caution we feel that we have made real progress. We have, first of all, endeavored to knit our organization together into a harmonious, well ordered unit. We have tackled the great problem of efficient marketing of farm products and now have a committee of seventeen of the best marketing men in the United States working out the principles and details of a plan which, when finally completed and adopted, should revolutionize marketing methods and secure for the farmer a greater portion of the consumer's dollar. It is too early yet to announce just what plan will be adopted, but the progress made is encouraging.

One committee is working on the marketing of grain, another on the marketing of live stock, and the Federation has called conferences which will probably result in a committee to work on the marketing of dairy products and another to cover the truck and vegetable field.

Our presentation of the farmer's viewpoint on the railway rate increase case before the Interstate Commerce Commission was practically the only argument made for the public. It is believed that the statistical data presented by our representative after several months of investigation was effective in bringing about the reduction of a billion and a half dollars in railroad valuation on which the rates were computed.

We have attacked national legislative problems and have already had considerable success in getting favorable action before Congress and through the various commissions and bureaus at Washington. Our Washington office is constantly at work on the farmers' legislative and economic problems and the review of a month's activities at that office discloses an amazing variety of interests, all of which intimately affect the farmer's well being.

A Month at Washington

A hurried review of a recent report of the Washington office shows: a study made of the general financial and credit situation including a number of conferences with the Secretary of the Treasury and the Governor of the Federal Reserve Board; securing through the Interstate Commerce Commission a readjustment of rail-lake rates so as to encourage water transportation of grain; intercession with the Attorney General in connection with action brought against the California Raisin Growers' Association; securing modification of prohibition rulings so as to enable cider to be freely produced and sold; investigating conditions in the canning industry with a view to getting better prices for canning stock; protesting to the President against the proposed removal of a member of the Federal Reserve Board who had shown an understanding of the farmers' credit needs; securing from the U. S. Treasury Department official approval of a Farm Account Book which will enable the farmer to make his returns with much less trouble; studying the income tax system of England; securing an emergency supply of refrigerator cars for the peach and grape shippers of New York State; arranging for daily telegraphic market news throughout the Middle West in co-operation with the U. S. Bureau of Markets; protesting to the Attorney General against the acceptance of the stockyards disposal plan proposed by the packers; appearing before the Federal Horticultural Board to argue a change in policy as regards the establishment of quarantine, restricting same to portions of states rather than quarantining an entire state; investigations concerning the organization, scope, purpose, and present efficiency of the International Institute of Agriculture at Rome; studying the world wool marketing situation and investigating the possibility of utilizing wool supplies through the making of blankets and cloth on a toll or cash basis for the farmers' use; presenting to the Department of the Interior arguments relative to Arizona homestead eviction cases and Wyoming water rights cases; taking up with the Interstate Commerce Commission the matter of reclassification of nitrate of soda so as to secure a freight rate more nearly comparable with the commercial fertilizer rate; prosecution of cases of alleged discrimination against co-operative shippers in Indiana; investigating the possibility of a coal famine in the Northwest during the coming winter; and many other matters of a similar nature.

In addition to this, "getting ready for Congress" is, of course, a game all in itself.

The A. F. B. F. Legislative Program

A great number of bills of outstanding importance to the farmer are now before Congress or soon to be introduced. The most important of these are listed below:

The Capper-Volstead Bill, designed to remove all doubt as to the legal right of agricultural producers to market their products co-operatively.

The Kenyon-Anderson Bill providing for the creation of a commission which shall regulate the operations of meat packers through a system of licensing.

The French Truth-in-Fabric Bill would require manufacturers of woolen fabrics to honestly label their products in such a way as to show the final consumer the percentage of wool and the percentage of shoddy used.

Standard Containers (Vestal Bill), a bill to standardize baskets, hampers, and other containers of fruits and vegetables so as to require them to conform to well known and easily recognized sizes and shapes, thereby eliminating confusion and fraud.

The Kahn-Wadsworth Bill authorizing the government to operate the air fixation nitrate plant at Muscle Shoals, Ala., for the production of nitrate for fertilizer.

The Nolan Bill is a bill drafted and backed by labor and manufacturing interests and designed to shift a much larger share of the tax burden on the shoulders of the farmer. The bill provides a flat tax of one per cent (in addition to all other taxes) upon all land values in excess of $10,000 excluding, however, the value of all buildings thereon.

A German Credit Bill (Smith Bill). Congress will be asked to grant a credit to Germany approximating a billion dollars, to be used in buying agricultural products and other raw materials in their country, this being approximately equal in amount to the funds now held by the Alien Property Custodian.

The Townsend Highway Bill. Farmers favor a national road policy which will provide farm-to-market roads rather than "through" roads designed principally for long distance hauling and touring. The present Federal Aid system, involving the 50-50 principle whereby the government stimulates road building by matching state and local funds, is believed to be better suited to meet the road building needs of the country as a whole than is the "through" road plan proposed in the Townsend Bill. Due provision must be made, however, for "through" roads in undeveloped sections.

Farm Financing Measures. The Federal Farm Loan Act must be strengthened and extended. All questions of the constitutionality of the tax exemption feature must be removed.

The Federal Reserve Act must be amended so as to permit of freer and more direct access to the benefits of the act by producers of agricultural products.

A Rural Credits Bill embodying the necessary features to provide operating funds to worthy farmer borrowers not having ordinary commercial banking credit must be provided.

Taxation of Profits vs. Taxation of Capital. In anticipated tax revision measures the farmer demands that the principle of taxation of profits and income rather than the taxation and consequent reduction of production capital be observed. Any attempts to eliminate the excess profits tax and place the burden on weaker shoulders must be opposed.

Tariff Policies. The farmer demands compensatory privileges, either through tariffs or basic trade provisions, as a protection against the agricultural competition of countries having a standard of living not on par with our own, and as an equalizing offset to the great benefits constantly enjoyed by the industrial world by reason of extensive tariff protection.

Putting the Farm on a Business Basis

W. F. Handschin

W. F. HANDSCHIN

In attempting to work out the most successful organization for a dairy farm we need to have two kinds of information. First, we need to know the facts and principles involved in the organization of farms in general, as well as dairy farms in particular; and, secondly, we must have the detailed facts regarding the particular farm under consideration.

The first class of information will be obtained largely through the study of the principles of economics, farm management, and accounting as applied to dairy farming; the second can be secured only through a detailed study, by means of records, accounts, and analysis, of the particular farm business to which the general facts and principles are to be applied.

The Field Still New

While the definite information available regarding the principles involved in the organization of dairy farms is still far from complete, a good beginning has been made, and much valuable data is being added by the various agencies interested in the collection and interpretation of such facts. Most important among these agencies are the state colleges and the United States Department of Agriculture; cow testing associations and other associations of dairymen, both state and local; the farm bureau; and various other organizations, both public and private, primarily interested in getting at the real facts regarding the business of dairy farming.

Much Information Already Available

We have facts on the distribution of farm property investments, such as land, buildings, machinery, equipment, and live stock. We have information as to the difference in the productive capacity of individual cows, the importance of selecting for high production by means of performance tests and the possibilities for improvement through the use of better foundation stock. We have information on the selection and combination of feeds and the most profitable methods of feeding.

We have made a fair beginning in showing the degree of diversity in production which will probably be most profitable for the dairyman, when measured by the net return for the entire farm as a unit. That is, the extent to which the dairy farmer will find it profitable to grow crops for feed or sale, and to what extent he may be justified in taking up the production of other classes of animals such as swine, sheep, or poultry.

We have considerable data showing both the man and horse labor requirements per acre and per cow, for farms in several important dairy regions. We know the cost of producing dairy products not only in terms of money, but, what is much more important, in terms of the feed, man labor, horse labor, and shelter requirements.

Size of Farm

Much of the discussion regarding the size of farm in this country has not given sufficient recognition to the differences between the United States and the older and more densely populated countries. While we are constantly having our attention called to small dairy farms, which have been unusually profitable, the usual conclusion that they are profitable because they are small and well tilled does not seem to be generally warranted.

PIGS IN ALFALFA. ECONOMICAL PORK PRODUCTION IS AN ALMOST NECESSARY ADJUNCT TO PROFITABLE DAIRY FARMING

The results of the farm management contest, including accounts from 150 farms, conducted jointly by Hoard's Dairyman and the Department of Farm Management of the University of Wisconsin during the year 1913 as reported in Hoard's Dairyman for April 10th, 1914, indicates that the most profitable dairy farms in Wisconsin are approximately twice as large, as measured in acres and total capital, as the average farm in the counties in which they are located.

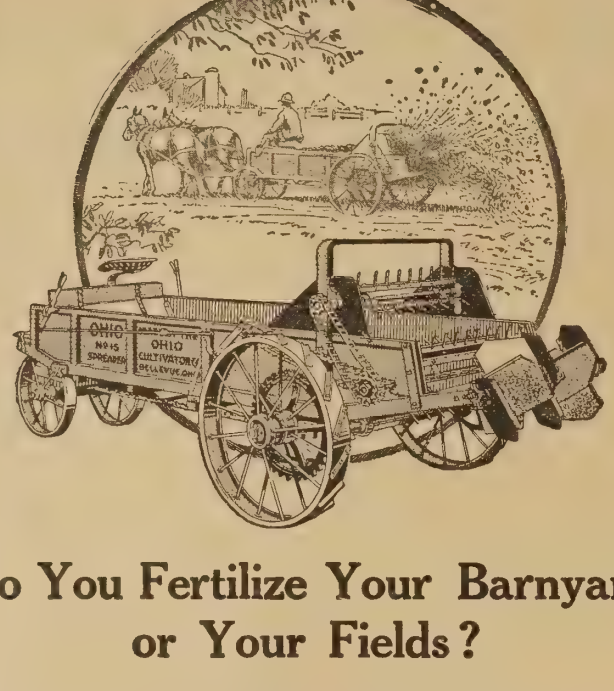
Boss, Benton, and Cavert reporting in Bulletin 172 of the Minnesota Station on "Factors Influencing Profit" draw the following conclusions, based on their study of 400 farms in one of the most highly developed dairy counties in Minnesota: "Five factors were found to be important in obtaining satisfactory labor incomes: (1) size of farm; (2) crop yields per acre; (3) returns per unit of productive live stock; (4) number of days of productive labor annually accomplished per man; and (5) number of days of productive labor annually accomplished per horse." Also that "The size of the farm business is a factor which usually very greatly influences the size of the labor income. With other factors the same in a large business as in a small one, the large business will return the greater labor income.

Nicholls and Hutson in Bulletin No. 127 of the Kentucky Station make the following statement based on their study of 162 dairy farms: "On the average, the good sized farms made larger profits than the smaller farms."

Warren, in Bulletin 349 of the Cornell Station based on an analysis of the records of 2,743 farms, draws the following general conclusions: "Of course, there are other important factors for success in farming, but on the great majority of farms the area in crops, the yield of these crops, the returns per animal, and the diversity of the business are the most important factors."

On the basis of all of the data available, the most profitable dairy farms are those which range from 50 to 100% larger in the size of their business than the average farms. It would seem to be fairly well demonstrated, therefore, that farms of average size or smaller which make unusual profits under the present economic conditions obtaining in the United States do so in spite of being handicapped in size rather than because there is merit per se in "the small farm well tilled".

Distribution of Investment



The distribution of investment in the various items of farm property depends in large measure on the amount of capital available. The dairyman whose capital is limited should give serious attention to the question of getting control of a business large enough to offer adequate opportunity to fully utilize not only his labor but his managerial skill. It may be to his advantage to rent all or a part of his land. In case he is very limited as to capital, he may also rent all or a part of his live stock and equipment. If we may quote again from the conclusions drawn by Warren in Cornell Bulletin No. 349, published in 1914, we shall find the question admirably summed up in the following paragraph: "For efficient farming in New York an investment of $10,000 to $20,000 is usually necessary. In states where land is higher in price a larger amount is needed. Occasionally a farmer does well with a capital of $5,000 or even less, but such instances are not numerous. With less than $10,000 it is usually necessary to work with very inadequate equipment, poor stock, and too little land. The capital need not all be owned by the farmer. The land and some of the stock may be furnished by a landlord, so that the tenant farmer need not have a very large capital. One who owns a farm may borrow part of his capital or may own some land and rent additional land."

Where it is possible for the dairyman with limited capital to rent land, stock, and equipment on reasonable terms, he will do better to do so than to handicap himself by trying to operate entirely with his own limited capital. While he may well look forward to the time when he may be able to own his own land and equipment, until he can do so on advantageous terms he will do well to be guided by economic experience.

For the dairyman who works largely or entirely with his own capital there is still the problem of making the best distribution of his investment. He must decide what proportion of his capi-

Do You Fertilize Your Barnyard or Your Fields?

The manure pile beside the stable door is washed by the rain and soaked by the drippings from the eaves, and in six months one-half of its fertility is in the only soil on the farm where crops are never grown.

The hauling and spreading of what is left—using the old farm wagon—is the sort of work that drives the farmer's boy to city tasks.

Get a spreader—the kind that is built to last—and put it where the manure pile used to be. It will double the value of the manure and reduce your work by half.

The famous Ohio is made in two easy-loading styles—the Bellevue No. 10 and the Ohio No. 15. Forty years of experience in the manufacture of farm implements is built into every spreader. See your dealer today.

SILOS
at Pre-War Prices

I will sell my present stock of silos, as long as they last, at PRE-WAR PRICES. Get your order in early and save money. Silos are all new, of well-known make, and furnished in the genuine Clear Oregon Fir, the most durable material used for silos. Quality guaranteed. You deal direct with me. No agents, no salesmen to come between us.

M. L. SMITH
118 Flood Bldg. Meadville, Pa.

tal he will invest in land, buildings, machinery and equipment, and live stock. In most of the important dairy regions of the Middle West, as based on the census returns, the investment in land makes up from 60 to 70 per cent of the total investment. On the basis of the somewhat more detailed studies made in several important dairy regions, the proportion invested in land is even higher for the most profitable farms. This is perhaps due, in most cases, to the fact that these farms are larger than the average, and the investment in buildings and equipment therefore makes up a relatively smaller proportion of the total investment than it does on the smaller farms. That is, it is possible to make more efficient use of buildings and equipment on the larger farms. The investment in these items is therefore less per acre.

While the proportion of the investment in buildings must necessarily be higher for the dairy farm than the general farm, it is important to keep it down to the lowest possible point consistent with: (1) comfortable housing for animals; (2) economy in operation, particularly in the use of man labor; (3) satisfactory housing for feed, machinery, and miscellaneous supplies; and, (4) a reasonable upkeep and depreciation charge.

An investment of $30 to $50 per acre in farm buildings, i. e., exclusive of the farmer's dwelling which is a personal item, means an annual expense of from $3 to $6 per acre per year for this item alone. That is, it may frequently equal or even exceed a fair rental for the land in the community. This is especially likely to occur when the investment in buildings is high or the farm is small. When both of these conditions obtain on the same farm the burden becomes doubly heavy.

The same general principles apply equally to the investment in machinery and equipment. While it is smaller per farm and per acre, the carrying charge for upkeep and depreciation is relatively higher. The amount invested in these items should therefore be kept down to the lowest practicable minimum.

The proportion of the investment in live stock will be determined by the amount of stock which is to be carried. If all of the crops produced are to be fed, the proportion of investment in animals will be higher than where only a part of the crops are fed on the farm. If the farm is to be stocked to the point where additional feed must be purchased, the proportionate investment in animals, buildings, and feed will increase.

The question of investment in live stock is necessarily also affected by the quality of the animals carried. If high grade or pure-bred animals are used, the investment in this item is higher than with low grade or scrub stock.

The Productive Organization

We come now to the question of the organization of the cropping system and the relation which it shall bear to the system of animal production. In working out the productive organization of his farm, the dairyman needs to think not only of the herd and its profits but of its relation to the crops and other stock of the farm from the standpoint of making the largest net return for the entire farm business as a unit. He must decide whether he will attempt to grow all or a major portion of the feed; whether he will grow some crops for direct sale, or whether he will depend to a considerable extent upon purchased feed to carry his animals. He can answer these questions best perhaps by studying the results of successful dairy farmers.

Diversity of Production

Pearson, in Illinois Bulletin No. 216, entitled "The Cost of Milk Pr duction", reports that for 680 dai farms, located in Kane and McHen counties, (1911—12) the average ca receipts per farm were $2,448 f milk, while the other receipts fro various sources were $1,647. That more than 40% of the farm receip were from sources other than the sa of milk.

The results of the 150 farms stu ied in the Wisconsin Farm Manag ment contest already referred to, sho that these farms received on the a erage 23.07% of their total receip from crops; 36.1% from the sale live stock; and 36.29% from the sa of live stock products. The farms ca ried on the average 5.21 horses, 17. cows, 20.39 ewes, and 6.65 brood sov per farm. If we study the data f the ten most profitable out of the t tal of 150 farms we find that pra tically the same proportions of oth animals were kept in addition to t dairy cows. That is, these farms we to a considerable extent diversifie they grew good crops, raised most their own feed, and fed it to dai cows, sheep, and swine, with the m jor emphasis in the dairy enterpri

Warren in Bulletin No. 349, say "A well balanced combination of ca crops and live stock usually pays be ter than does either extreme. The be combination varies with the amou of money that the farmer has, wi the quality of the live stock kept, a with the profits that come from cro Even with very profitable live stock nearly always pays to have some ca crops to at least a fifth of his tot sales. Unless the returns from li stock are very poor or unless t amount of money is very limited, usually pays to get at least half the income from stock."

Importance of Man Labor

In all lines of farming the cost man and horse labor is growing in i portance. This is true of dairy far ing, especially where man labor mak up a larger proportion of the total e pense than in more general farmin In the production of dairy produc man labor makes up from 20 to 30 of the expense of production, whi it makes only 5 to 10% of the e pense involved in the production pork, beef, and mutton. It is ther fore doubly important to make t most economical use of man labor dairy farming. This is to be accon plished mainly by means of a good r tation and diversification with li stock. These make possible a mo even distribution of labor throug out the year, so that each man a complishes more work. In developin efficiency and economy in handlin farm labor, management is of fir importance. Labor economy is large a matter of wise planning, whethe there are two or twenty men on th farm.

Keeping Farm Accounts and Record

Much emphasis is laid on cost a counting for the farmer, on the im portance of his knowing how much costs to produce corn, oats, whea beef, milk, and wool or other far products.

While it may never be possible fo any large proportion of farmers t determine their costs of productio for individual crops or animal prod ucts, it is important that farmer generally should have such informa tion regarding costs to determin which of their enterprises yield th greatest profits. Such information i already available in considerabl measure for many sections wher dairy farming is of importance. Fo most farming regions fairly definit standards are known as to what yields can be secured for the various farm crops. We know what are rea sonable standards for dairy cows per month or per year or in relation to the

kind and amount of feed consumed. We know standard requirements as to the number of crop acres which can be worked per man and per horse in most of our important types of farming. Fairly satisfactory standards as to the labor requirements are also available.

Applying Data Available

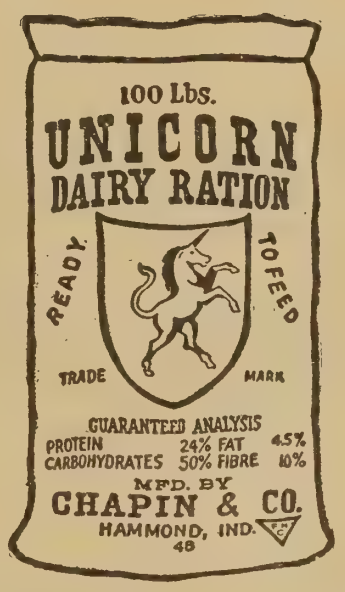
It is possible for the farmer to make all of the major adjustments in the productive organization of his business. This would include, mainly, records of crop production, feeding records, records of production for milk, butterfat, and other annual products, and a record of the inventories and financial transactions of the farm business as a whole. With such records available the farmer can make an intelligent analysis of his business and go ahead with a somewhat systematic organization of his farming operations.

Cost of Production and Price

For those who are expecting large returns from cost accounting as a means of price fixing, the writer can hold out little encouragement. Costs for the same product differ so widely on different farms and with different men, as to make the satisfactory fixing of prices on the cost basis impossible. A certain proportion of the producers engaged in any line always have costs so high as to make the matter of assuring them their costs of production out of the question. Any arrangement which does not assure, or guarantee, to all producers their costs of production will of necessity result in dissatisfied producers. Besides, if the least efficient producers are all guaranteed a profit we shall have no means of eliminating those who do not render an adequate return.

Those of us who do not believe in complete socialism must, it seems to me, be forced to the conclusion that without this constant process of elimination we can have no healthy industrial life either in agriculture or elsewhere. The bankruptcy court, the employer who weeds out the least efficient worker, and the competitive market which forces the inefficient farmer to accept a price below his cost of production constitute, after all, the public's best guarantee that it is being better served than it might be under a non-competitive system.

It is plain that a large proportion of farmers must have cost of production "plus a reasonable profit" if they are to continue producing. Otherwise they will transfer their activities to other lines of production. It does not follow, however, that at a particular time, or for any given article, the farmer or any other producer will be assured of getting back his costs of production. Just now farmers are suffering because they are being forced to sell some of their crops at less than it cost to produce these crops. But the same is likely true for automobile tires and other important commodities.



While costs must correspond with prices in the long run, they do not necessarily correspond at any given time. Nor can they correspond for all producers of the same commodity at any time. The writer believes there is still much work which must be done by farmers before we can have even a fairly satisfactory distribution of farm products and a reasonably just basis for prices between producer and consumer. In spite of the fact that the law of supply and demand does not ever operate with 100%, or even 90% efficiency perhaps, it has not been repealed, as many would have us believe. It has only been set aside here and there by government control, and because of violently abnormal conditions growing out of the war. It will be, in spite of many difficulties and inequalities, the chief factor in helping us to return to a normal financial and business basis.

While cost figures will have some value in the marketing of farm products, their chief value would seem to be in their application to the productive side of the business. They serve to point out which enterprises or products are returning the largest profit, as well as those which are responsible for losses. Cost data should serve as the means whereby the dairy farmer can analyze his business and work out the most effective organization from the standpoint of the essential requirements for successful operation.

Summary

Summed up, the requirements for the successful dairy farmer may be stated as follows: (1) He must have a business large enough to represent an economic unit for the region and type of farming carried on. (2) He must grow good crops. (3) He must feed the crops to good live stock, and be a good feeder and caretaker. (4) He must introduce a reasonable amount of diversity with crops and live stock in order to make the best use of his man and horse labor. While other factors may be of importance for the large majority of dairy farmers, the factors mentioned are of first importance in contributing to the success on a business basis.

One Way to Save Feed

A McHenry County (Ill.) herd of 23 grade cows produced $743 worth of milk from $164 worth of Unicorn, fed straight.

Your own grain ration may be getting every pound of milk out of your cows that they can give.

But have you figured feed against milk?

You may be astonished to find that for each dollar you spend for feed you are getting a return of only $2 or $3 in milk.

Where Unicorn is fed, $1 paid for feed brings you a return of $4 or $5 in milk.

Your own ration may be getting the milk, but it is not getting the profit.

Change to Unicorn. Get the same amount of milk, with less money spent for feed. The saving is clear profit.

CHAPIN & COMPANY
Chicago
New England Office at Boston

My Creed of the Out-of-Doors

I believe in the wonder of the out-of-doors, in the inspiration of the stars, and in the allurements of life in the open, and

I believe in the strength of the hills, in the silence of the night, and in the music of the birds and trees.

I believe, also, that my body was made for action, that my mind was made for thinking, and that my heart was made for loving in unison with the life in nature.

I believe that to laugh and sing, to swim and walk, to study and play, to eat and be happy, to be kind and free, to grow strong and good, is my God-given right.

I believe, too, that to be happy, I must be good, that to be worthy I must be kind, that to be loved I must think love.

I believe that God is as near as man, that I can hear Him in the brooks and pines, and that happiness and lasting peace are mine, as I live in the atmosphere of kindness so near me in the life or the open world.

Cottonseed Meal Low in Price

SANDERS SOSLAND, MISSOURI

WHILE all feedstuffs have been under extreme pressure on markets, the high protein feeds, particularly cottonseed cake and meal, have experienced the most radical price readjustment. Linseed cake and meal, also bran and shorts, alfalfa, manufactured balanced feeds and the whole grains, have undergone a rather sharp revision downward, but none has maintained the pace set by the by-product of cottonseed. On the basis of the protein unit values of the various commodities used in dairying and other live stock operations, cottonseed cake and meal are the cheapest feeds available on markets of the United States. For instance, cottonseed feed, with a protein content practically three times as great as that of bran, is selling at an actual discount under the wheat mill offal in most consumptive channels.

A serious lack of demand brought about the depression in cottonseed cake and meal, which is now selling at an actual discount under the levels prevailing before the world was plunged into war in 1914. Cake and meal of 43 per cent protein content is being offered rather freely in Texas, one of the most important crushing states of the South, around $23 to $24 a ton for prompt or January shipment, basis crushing plants. The price at Little Rock, in Arkansas, averages around $27 to $28 a ton, and around $28 a ton in Memphis. Basis the Kansas City market, probably the greatest distributing center for the protein feed, cake and meal of 43 per cent protein content and of prime quality is being offered around $31.50 and $32.50 a ton. Indicative of the extremely bearish sentiment which still pervades the market, is the fact that Texas crushers are offering prime cake and meal for February shipment down to $22.25 per ton, so it is generally presumed that, without an absorptive demand on the basis of the current prices for prompt shipment, values must necessarily work down to the February level.

Cake and meal at $22 to $23 a ton in Texas compares with a price at the opening of the crop year around $65 to $70 a ton. During the period of record-breaking markets the past two years, cottonseed feed sold at about four times the present prices—and was very difficult to obtain even at those sensational figures. Then, it was not a question of price, but of obtaining supplies. With the exception of a brief period in July of 1915, about the time the now memorable buy-a-bale movement was in progress, when cake and meal sold down to $18 a ton, the current quotations are the lowest in many years. In 1911, for instance, cake and meal sold up to $28 a ton, basis Texas.

Dairymen, range cattle handlers and other feeders, while providing the principal outlet for cottonseed cake and meal, are comparatively small buyers. The excellent fall and early winter weather, together with the superabundance of various feeds in the country, have allowed a sharp reduction in the demand. Radical depression in cattle prices also has been a factor in the small buying by cattle feeding interests. The manufacturers of fertilizer and commercial mixed feeds, who normally absorb thousands of tons of cottonseed cake and meal, have bought very sparingly on this crop, due largely to the almost stagnant demand for their own products. And the exporters who, before and even during some of the war period, provided an outlet for the great bulk of the domestic production by crushers, have bought on an exceptionally small scale thus far on the crop. The foreigners are seriously lacking in credit with which to make purchases in the United States, and they are more concerned about financing the purchases of wheat and wheat flour rather than cottonseed cake and meal. It is improbable that European countries will become important buyers of the high protein feeds in the United States this winter, in which event it is doubtful whether values will enjoy any material upturns.

There is a considerable surplus in the hands of crushers, speculative jobbers and other interests, and some time will be required to work off this surplus. Also, it is probable that the crushing season will be longer on this crop than in previous years, owing to the slow sale of cottonseed, the producers having been keenly disappointed over the prices offered them, less than $20 a ton. In this connection it is interesting to note that, though operations of mills have been limited to little more than half capacity, owing to slow seed sales, the market has been under extreme pressure. This does not offer much hope for rapid upturn in prices later in the season.

In face of the present weak position of the market, bearishness as to the price outlook is necessarily tempered by the fact that values already have undergone radical revision downward. The bulk of the crushing is expected to be out of the way before the close of winter, and crushers, instead of accumulating stocks for the spring and summer feeding demand, are making a strong effort to work off their production as rapidly as turned out. They have been seriously affected by the strain in credit, and they have not the credit facilities to tie up in large stocks. Therefore, the supplies may not be so abundant in the spring and summer, and firmer prices may result. Still, the prospects for a broadening in the demand for feed are of a character which lead one to temper enthusiasm on the bullish side of prices.

MAY WALKER OLLIE HOMESTEAD

She has just finished a year's record of 22,534.7 lbs. milk containing 876.24 lbs. fat as a 4-year-old and carried a calf 254 days of that period. She is a daughter of Piebe Laura Ollie Homestead King, the sire that has more 2-year-old daughters with records above 20,000 lbs. milk than any other. She is owned by the Minnesota Holstein Co.

Wisconsin Marketing Conference

Every group concerned with the readjustment of Wisconsin's agriculture and allied industries to present day conditions, will be represented in the "Get-together Market Conference" to be held in Madison, February 1 to 10.

Every organization of state-wide scope is being invited to participate in the convention. And the representatives of these groups are inviting to meet with them, to consider these definite questions, manufacturers, distributors, and consumers of farm products.

Plans for the convention are being laid by officials of the various bodies represented. The subjects to be considered in the course of the conference include possible legislation to make credit more readily available to the farmers, means of improving the transportation facilities of the state, and other problems of interest to the consumer and producer. Out of this program it is planned to develop a state agricultural policy.

The one man in America who knows most about world food conditions and world markets for raw products, outside of Herbert Hoover, is Dr. Alonzo E. Taylor. He will be at the conference to give the information he has collected. Throughout the war and since, he has divided his time between this country and Europe in a study of the very questions which every farmer is asking. He leaves the conference to sail to the continent to continue his observations of economic conditions. He will discuss "The World's Food Supply" and "The World's Buying Power".

"We propose to find out if anything can be done to straighten the road between the farm field and the family dinner table", say the officials of the prospective conference. "True to expectation, farm prices have fallen first and farthest and the constantly widening gap between producer and consumer is still further spread apart.

The farmers' prices today are determined largely by world conditions. The prices paid by the consumer of his product are too often artificially and locally controlled. Wisconsin's agricultural forces propose to get at the facts, remove unnecessary obstructions, smooth and straighten the road.—Wis. College of Agriculture.

HIGH WISCONSIN PRODUCERS

BROWNIE of Linwood, a senior four-year-old Guernsey in the Corium Farm herd, Wisconsin, has just completed a test in which she is credited with 831.07 pounds butterfat from 16,296.8 pounds milk. By this record she becomes the second cow in Class B. She freshened November 28, 1919; she produced 42.5 pounds of milk on her first test day and on her last test day, 36.5 pounds. This is the second A. R. record for Brownie of Linwood, her first being 10,761.7 pounds milk, 532.01 pounds butterfat at two years of age, making her a class leader in Class GG.

Brownie of Linwood was sired by Imp. Clara's Sequel, winner of several prizes and sire of 31 A. R. cows. Her dam is Lisette of Mt. Pleasant. She was bred by Homer Rundel of Wisconsin.

Another class leader just developed at Corium Farm is Bell's Paragon of Fox Valley who completed a year's official test on December 2 with a production of 11,740.7 pounds milk, 627.01 pounds butterfat, at 4½ years. This gives her tenth place in Class BB. Bell's Paragon of Fox Valley is sired by Wedding Bells of Waukesha, the sire of four A. R. cows. Bell's Paragon of Fox Valley was bred by P. H. Kuhts, Wisconsin. She carried a calf during 265 days of her test. Two half sisters of Brownie of Linwood are now on test, one of which will finish at about 550 pounds of butterfat.

Oregon Dairy Council's Work

HOARD'S DAIRYMAN:—"All difficulties are settled and the hatchet is buried way down deep." This was the report Charles Eckelman gave at the last meeting of the Oregon Dairy Council when he reported on conditions now existing with regard to the relations between the Oregon Dairymen's League and the Portland milk distributors.

Friendly relations now dominating both parties are progressing and general confidence is restored, according to the statement of the members, and great interest is being shown in the work of the Oregon Dairy Council. The council helped to the best of its ability in giving publicity to the Pacific International, which was a great show. It assisted the ice cream men in advertising their Pacific Coast convention held in the Portland municipal auditorium and the butter and cheese makers in their state convention December 9 and 10 in the Portland hotel. A feature of the latter meeting was the address by P. M. Brandt on dairy council work and possibilities.

The council has succeeded in starting milk stations in 12 Portland public schools where there are undernourished children and each school day now 3,800 children are being served with half pints of milk. The council started the stations after investigating conditions with the cooperation of Dr. Edna Eames, chief medical inspector, and the principals, teachers, and parent-teacher circles. Committees were formed and plans made to finance the stations. The council gave 1,000 straws, 1,000 tickets, and $5 cash to each as a starting fund. In one school where there are many poor children whose mothers work by the day, the parent-teachers raised a fund of about $300.

In one school the Chi Onega sorority girls are planning to operate a station and are planning a Christmas dance to raise the money. In another school the council started the work and the tuberculosis society is financing it. Some of the stations are practically self supporting where there are not many poor children. Great credit is due the milk distributors who have donated some milk and who have taken a great interest in the milk stations.

In addition to the serving of milk the children have milk leaflets and are given talks on health, cleanliness, nourishing foods and their values and many subjects that make them better citizens.

The new board of the council will meet December 15 and elect officers. The secretary, Edith Knight Hill, in her annual report said: "I feel that this dairy council child has had a good start and has been guided past the pitfalls and I now turn it over to you, a strong young person, ready to do effective service for humanity, needing the guidance and the strong hand of a man of marked ability to lead it out into a broader field. Its educational work has touched every part of Oregon and I feel it has done good. It has a good name and sound educational and moral backing and now some capable man must give it the financial backing it deserves. I think the council is past the stage of babyhood.

Oregon. E. K. HILL.

C. LARSEN

Professor C. Larsen, for fourteen years head of the South Dakota dairy department and since 1918 also director of extension, has accepted the position of director of dairy marketing for the Illinois Agricultural Association. He will work with the Illinois county farm bureaus in marketing their products co-operatively and economically. His first work will be to assist the Southern Illinois Milk Producers' Association in establishing a co-operative milk marketing organization for the city of St. Louis.

Coming as a lad from Denmark, Professor Larsen worked on an Iowa farm and through Iowa State College, earning his bachelor's and master's degrees. He then returned to Europe to study dairying conditions and came to the South Dakota State College in 1907 as head of the dairy husbandry department.

Professor Larsen has built the South Dakota Dairy Department from a beginning with one student to a point where hundreds enroll annually.

There were 14 permanent county farm bureaus in the state when Mr. Larsen took charge of the extension work. There are now 46.

Wisconsin Register of Production

The first official Register of Production for cow testing associations has recently been issued by the Wisconsin College of Agriculture in cooperation with the Wisconsin Dairymen's Association. It contains a list of all cows in these associations that have produced over 365 lbs. of fat during the cow testing association year, providing the owner joins an association the succeeding year.

The purpose of issuing this register is stated as follows:

"1. To secure better breeding, better feeding methods, and better care for Wisconsin dairy cows.

"2. To emphasize the necessity of judging a bull according to the work of his daughters.

"3. To increase the purchase and sale of cows on the basis of yearly production, and of calves and bulls on the production of their dams.

"4. To establish recognized yearly records for pure-bred and grade cows when these cows would otherwise be without records."

The publication discusses the basis of profitable production, gives the rules governing entry in the register, and details the production record of the 421 cows entered. The average yearly record of these cows is 9,464 lbs. milk containing 407.8 lbs. fat, 27 cows producing over 500 lbs. fat. The feed consumption of each cow is given, which provides figures for analysis and shows how the good dairy farmer is feeding his cows.

This circular of forty-eight pages is put out under the title of "Profitable Cows" and should be of value not only in demonstrating how such cows are handled, but also give the prospective buyer information as to where forward looking breeders of good cows are located. Copies of this circular will be supplied on application to the College of Agriculture, Madison, or the Wisconsin Dairymen's Association, Fort Atkinson, Wisconsin.

A Better Beet Contest

The beet growers of Fond du Lac County, Wisconsin, have found a friend in their county farm bureau. The county bureau has got these men together and it proposes to attend to securing an agreement with the sugar companies providing for a better contract. Some of the changes asked are as follows:

The attempt will be made to have only one company ship from each station. This is so that the company will have a sufficient acreage to find it profitable to install a mechanical unloader at such station.

Other recommendations are that a contract will provide that the sugar company will have no mortgage or lien on the growing crop and they will not have the authority to force delivery of an unprofitable crop; also that the grower can secure beet pulp at cost according to the amount of beets he furnishes the company.

On prices it is being asked that the bonus to be paid the growers shall be based upon a twelve months' average price of sugar rather than on a four months' average of October to January, as it now stands. It is also asked that the item of labor costs be definitely fixed and should it be necessary to increase them that the farmer will be compensated by increased price per ton of beets delivered. It is also asked that the growers have some consideration paid them as to fixing the price to be paid for beets, with some thought given to the cost of production.

Jersey Cattle Notes

For week ending Dec. 10: Number of animals registered: Bulls, 158; cows, 384; total, 542. Number of transfers recorded: bulls, 231; cows, 725; total, 956.

Belgian IMPORTED MELOTTE

Jules Melotte—*"The Edison of Europe"*—has again placed his **Great Belgian Melotte Cream Separator** on the American market and is continuing his pre-war offer to the American farmer. *Free Trial—Small First Payment—Easy Terms—Duty Free.*

You, who have wanted the world's greatest separator, write for catalog right away. Find out why 500,000 Melotte Separators are in use today. Read how in England, where every penny must be saved, more Melotte Separators are in use than all other makes combined. Before buying any separator find out how the Melotte has won 264 Grand and International Prizes and every important European contest the last 16 years. Mail coupon now for our great offer.

No Money Down

You are not to sent one cent until you have used this Great Belgian Melotte on your own farm and thoroughly made up your mind that it is the separator you want to buy. Keep it for 30 days—use it just as if it were your own machine. Test the wonderful Melotte.

Self-Balancing Bowl

DUTY FREE

See why *this* bowl can't vibrate nor get out of balance—why it can't cause currents in the cream—why it can't re-mix milk with cream. Compare the Melotte Separator with any other—test them side by side. See for yourself which works easiest—which is most profitable—which operates at least expense—which is most sanitary and easiest to clean. Then send your skim milk to the creamery—let *them* prove which separator skims the cleanest.

Easy Payments After 30 days, when you are completely satisfied that the Belgian Imported Melotte is, by far, the best cream separator to be found any place in the world (a big statement, but true), then make a small payment down. Settle the balance in small monthly payments. The Melotte pays for itself from your increased cream checks. Mail the coupon *now*—today.

READ! Easiest to clean. Few plain discs, all alike, go back in bowl in any order. Bowl chamber is PORCELAIN LINED. Has smooth, rounded surfaces—no crevices. Easy to clean as a China plate. Can't rust. One-half less tinware to clean. Easiest to turn. W guarantees that the 600-lb. capacity Melotte turns easier than any other Separator of 800-lb. capacity. Bowl spins 25 minutes after you stop cranking unless you apply brake. No other separator needs a brake.

Send Coupon!

Fill out and mail the coupon for new Melotte catalog containing full description of this wonderful cream separator and the story of M. Jules Melotte, its inventor. Don't buy *any* separator until you have found out all you can about the Melotte. Sending coupon below does not place you under any obligation whatsoever. It brings you new Melotte catalog and full description and details of our Great Special Offer. Don't do another thing today until you have mailed coupon.

The LAUSON

The farmer's wife is a good judge of farm engines. But she judges by the way they work. To lighten her work it must start easy and be free from trouble. Imagine her rinsing clothes one minute and "fussing" with a faulty magneto the next minute.

The Lauson Junior has long been favored by women on the farm. Many is the farmer's wife who takes pride in her dairy, with cream separator and churn run by a sturdy little 1¾ H. P. Lauson Junior.

And many is the farmer who has started with a Lauson Junior in the dairy and added a powerful Lauson "Full Jewel" Tractor for the field and heavy belt work.

Which catalog do you want—engine or tractor? They are both picture books of Lauson performance.

Lauson tractors and farm engines have been built from the beginning to **look** the part—inside and out. The service they give is the final proof.

The John Lauson Manufacturing Co.

53 Monroe Street

New Holstein, Wisconsin

20 to 25% Bigger Winter Milk Yields

WITH pure, rich milk analyzing 87% water—and with your winter herd *getting only ¼ to ⅓ of their natural water requirement from icy outdoor tanks,* you can see where cold weather cow-thirst is one of the biggest causes of your year-after-year winter milk shortages. With

Simplex Improved Water Bowls

your cows drink "to their hearts' content" day and night. Result—*20 to 25% more milk from every cow all through the housed-in season.* And no more frozen tanks—no tank-heater make-shifts—no more twice-a-day "herding out" periods. *Write for Full Information on the Modern Miracle.*

Improvement Comes Through Co-operation

(Continued from page 1031)

prices on the part of private individuals. The power to fix prices comes from monopoly of trade and a consequent control of the market. The result is that in certain branches of distribution such as the packing trade, the sugar trade, and the wool trade, the possibility of competition is shut off and any attempt on the part of independent concerns at competition is crushed. It is clear that this power of private individuals to fix prices gives them the opportunity to charge a higher remuneration than their services justify. It is also clear that the extra remuneration which they receive is deducted from the share either of the producer or the consumer. It is this privilege, acquired through monopoly, which creates the abnormal situation of a group of individuals having the power to appropriate more than the just value of their services.

It is, moreover, important to bear in mind that distribution is only one phase of economic life and can be considered effectively only in connection with the other phases. Any fundamental defect in production reflects itself in distribution and vice versa.

The processes of production, distribution, and consumption are closely related. It is impossible to draw a clear line between them. Because of that a fundamental defect in any one of these three fields causes certain defects in the other fields. It is clear, then, that we must work towards a system in which everyone concerned in the production, distribution, and consumption of goods receives a remuneration equal to the services he renders. This can be attained through co-operative organizations of producers and consumers and through an arrangement whereby the prices of commodities will be fixed by an agreement between all the agencies concerned in production, distribution, and consumption. This ideal arrangement can be attained only by slow and gradual steps. Until then the present system of distribution must be gradually improved through the elimination of waste and unnecessary expense, a free field must be left for competition, and anything that hinders free competition must be done away with.

It is clear that this gradual process of improvement depends to a very considerable extent upon the progress of co-operation and the development of co-operative associations. Co-operation in marketing and buying is the best method to eliminate the unnecessary waste and expense and it also gives the necessary strength to bring about improvements in our economic system.

How waste in distribution comes from poor handling. Potatoes are scooped into the graders with forks and the resulting bruises and injuries are a source of rotting in storage.

New England Holstein Breeders Organize

The reorganization of the New England Holstein-Friesian Breeders' Association came to a successful close December 9th at Pittsfield, Massachusetts, the last of a series of meetings scheduled for the purpose. Through this campaign New England breeders are assured of a minimum budget for the three years 1921—24 of $21,000. This makes it possible to engage a field secretary and the necessary assistants to improve Holstein interests throughout the northeastern states. This secretary's work will consist not only in developing markets for surplus breeding stock of pure-bred and high grade Holsteins, but in fostering appreciation of the value of the black and white cattle among New England dairymen themselves.

Forty-five meetings were held in the six states comprising the New England group. Two meetings were held each day. President D. D. Aitken of the National Association spoke at all of the 45 meetings held, except a few meetings in Maine. R. C. Pollock of the Extension Service of the National Association who has helped in all the state association campaigns was another principal speaker. Co-operation by the county agents and the state agricultural departments and the colleges did much to help the work.

Through this association New England breeders will have their 30,000 pure-bred Holsteins and countless black and white grades recognized as to their immense importance in the production of the $40,000,000 supply of milk required each year for the congested areas of New England. Taking New England as a unit, only two states have more pure-bred Holsteins—New York and Wisconsin. A better market for the surplus stock of the breeders of pure-breds and grade black and whites will mean hundreds of thousands of dollars in revenues not now obtained.

President Aitken urged the breeders to eliminate the 5,000-pound producer and work towards the cow which will average 10,000 to 13,000 pounds of milk a year. He advised improving herds by grading up by the use of a pure-bred sire in community breeding, making it possible for smaller breeders to use good bulls. He spoke for increased use of dairy products on the farms as well as in the cities and the elimination of standards in different states now tending to increase the cost to the consumer and to confuse and hamper dairymen in the production of milk and its marketing.

A meeting of all of the members of the New England Holstein Breeders' Association will be held at some central point, during the last week of December or early in January. At this meeting new officers and new directors and an executive committee will be elected and the work of carrying on the association's business for the 3-year period definitely mapped out.—Holstein-Friesian Extension Service.

Missouri Creamery Short Course

A short course in creamery operation will be offered at the University of Missouri at Columbia from January 2nd to February 27th, 1921. Topics to be considered are creamery and milk plant management, creamery butter making, market milk, ice cream making, dairy bacteriology, judging dairy products, dairy machines and refrigeration, and milk production.

The children may not be getting their pint of milk a day. Have you thought out ways of making sure that each one takes his share?

Knowing things to be true that are not so, makes lots of trouble and misery in this world.

The American Farm Bureau Federation

(Continued from page 1032)

partment of Agriculture to be a highly essential factor in the development of American agriculture and that the products and benefits of its labors will be shared by all, the farmer insists that adequate financial support be provided for this, the only important producing department of the government.

The Program of Work

In order to properly correlate the tremendous variety of angles of the work it has been necessary to departmentize the organization. We now have in the process of formation the following departments: Department of Farm Economics and Statistics, Department of Transportation and Rates, Department of Marketing and Co-operation, Department of Education and Publicity, and the Legislative Department. In a general way the program of work of the Federation may be suggested by the outline given below.

General

1. To develop a completely unified national organization to act as spokesman for the farmer and to adequately represent the farmer and the farmers' interests on all occasions.

Educational

1. To create in the urban mind a better conception of the farmer's relationship to other units in the social and economic structure.

2. To re-establish agriculture in the public mind as the foremost industry, on which all others depend, and, in the prosecution of which man reaches his highest plane of development.

3. To encourage and assist in the development of food production to its highest state of efficiency.

4. To foster and develop all those lines of endeavor which make for better homes, better social and religious life, better health, and better rural living in every sense.

5. To conduct referenda on various national questions to determine farm sentiment before determining legislative action.

Legislative

1. To safeguard the rights and interests and to assert the needs of the farmer whenever occasion may arise.

2. To establish without question the legality of collective bargaining.

3. To insist upon the presence of farmer minds on all boards and commissions appointed by Congress or the President.

4. To defend the farmer's viewpoint in all matters relating to tax levies, tariffs, currency, banking, railways, highways, waterways, foreign markets, the merchant marine, territorial acquisitions and all similar legislative matters involving questions of policy, in any way affecting agriculture.

5. To insist on some arrangement between capital and labor which will insure freedom from disrupting and criminally wasteful strikes.

6. To strengthen the Federal Farm Loan Act and secure in addition the establishment of a system of personal credits.

7. To demand the regulation, under government supervision, of all commercial interests whose size and kind of business enables them to establish a monopoly dangerous to the best interests of the nation.

Economic

1. To extend co-operative marketing of farm crops to the point in the distribution system so that the maximum benefits are secured for the producer and, incidentally, for the consumer.

2. To limit the profits and reduce the costs of distribution in all lines not handled co-operatively.

3. To so estimate the effective world supply of any farm product and to so regulate the flow to market as to eliminate sharp and extreme price fluctuations.

4. To establish new foreign markets for surplus American farm products.

5. To provide cheaper sources of fertilizer and more economical means of production.

Executive

I. Department of Education is organized under the direction of a committee of three and the following general lines will be inaugurated:

1. A weekly news letter to farm publications.

2. Special news and story service to farm publications.

3. Co-operative service with farm bureaus, and so forth.

4. News and stories to city dailies.

5. Feature stories in magazines of the city press.

6. Service to rural weeklies.

7. Publications of special pamphlets, speeches, and so forth.

8. Miscellaneous publicity methods.

II. Department of Farm Economics and Statistics organized under direction of a committee of six. The principal functions to be taken up at once are along the lines of a careful study of agricultural statistics.

1. Improved cost accounting methods for farmers.

2. Crop statistics and forecasts.

3. Price analysis.

4. Weather reports with specific reference to agricultural needs.

5. Study of world's supply of agricultural products, crop conditions, and policies adopted for their needs.

6. Credit analysis.

7. Tendencies in tariff, merchant marine, and internal revenue legislations, ocean freights, and so forth.

8. Foreign competition.

III. Bureau of Transportation organized under the direction of a committee of four to function as follows:

1. Help to improve the service of our railroads to the greatest extent possible.

2. Prevent excessive transportation burdens on farm products.

3. Help to simplify traffic as a whole.

4. Trace tendencies, constantly, in the rates and regulations on agricultural products.

We cannot but feel that the A. F. B. F. has caught its stride in excellent shape in the first year of its existence. Many formidable organization obstacles have melted away and the program of work is well under way. Enough in the way of quick results has been already secured to satisfy the membership that with increased strength and whole hearted support the Federation may readily become one of the most powerful forces in the land. It may well fulfill the expectations of those who see in it a means of reshaping the fortunes of agriculture and of placing the farmer in a position of affluence and power equal to that of any other large group found in American society.

All that we need is a united front and loyal generous support. With these in full measure there is nothing within reason which the A. F. B. F. cannot accomplish.

Time to Look for Mites

This is the time of the year to be on the constant lookout for the presence of mites on the fowls, and particularly in the poultry house. These insect pests not only lower the vitality of the birds, and thus render them liable to disease, but their presence has a decidedly bad effect on egg production. Frequent spraying of all cracks and crevices of the house and the undersides of the roosts with kerosene or 5 per cent carbolic acid will greatly help to eradicate mites, and thus add to the comfort and general health of the birds.

Five Remarkable Years' Jersey Records

With the completion of her fifth official year's record Duke's Rachel Interested has proved her persistency. She was first started on Register of Merit test at two years and seven months of age; her last record was completed at the age of eight years and five months. During this time she has dropped five calves and is safely in calf again.

The first four of her records are Class AA; had she been bred about a month earlier during her last test she would have qualified for five AA records. As it is, she carried her calf about four months of her last record. In her five records she has averaged 10,752.4 pounds milk, 584.25 pounds fat. She was sired by Interested Prince, which has fifteen sons and forty-seven Register of Merit daughters, which have completed seventy-five years' tests. She was bred by Rufus A. Sibley, Massachusetts. She is owned and was tested by Ayer & McKinney, New York.—AMERICAN JERSEY CATTLE CLUB.

The noblest question in the world is: What good may I do in it?—BEN FRANKLIN.

2.50

FILTER YOUR MILK

CP CHAPMAN STRAINER AND FILTER

A combined strainer and filter for the price of strainer only. To use the Chapman as filter, insert a layer of cotton and sheet of gauze between the two screens.

The filter will remove bacteria, dandruff, hair, blood corpuscles, straw and other substances that a strainer only can't catch. Thus will greatly improve the quality and flavor of the milk and prevent it from souring quickly.

Can be quickly taken apart for cleaning.

Consists of heavily tinned charcoal steel bowl, ring lock, fine mesh brass screen and perforated tin screen. Cotton and gauze furnished at extra prices below.

Strainer and Filter Complete $2.50

Postage extra, 30c

Wgt. 2 lbs. Size 12" in diameter.

The Creamery Package Mfg. Company

68 W. Kinzie St., Chicago, Ill.

Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

Coming Events

Jan. 4—6, 1921, Wisconsin Cheesemakers' Association meets in Milwaukee. Secretary, J. L. Sammis, Madison, Wis.

Jan. 5—Iowa Holstein Breeders' Association annual meeting, Iowa State College, Ames.

Jan. 11—Wisconsin State Horticultural Society, Madison.

Jan. 11-12—Certified Milk Producers' Association of America meets at Ansonia Hotel, New York City. Sec.-Treas., Harry B. Winters, Albany, N. Y.

Jan. 11-13—Wisconsin Dairymen's Association, Madison, Paul C. Burchard, Secretary, Fort Atkinson.

Jan. 10-14—Annual Farmers' Week at Purdue University, Lafayette, Ind. The annual meeting of the Indiana State Dairy Association will be held Jan. 13.

Feb. 1-4—Manitoba Dairy Association will meet at Fort Garry Hotel, Winnipeg. Secretary, L. A. Gibson, Winnipeg.

Feb. 1-10—Mid-Winter Farmers' Course, Madison.

Feb. 1-10—Wisconsin Live Stock Breeders' Association, Madison. Geo. W. Davis, Secretary, Madison.

Feb. 4 & 5—State Live Stock Judging Tournament (roundup), Madison.

Feb. 16—18, 1921—Virginia Dairy Show and Annual Convention of the State Dairymen's Association held in Roanoke. Secretary, Frank A. Buchanan, Blacksburg, Va.

Wisconsin Dairymen's Association

The Wisconsin Dairymen's Association will hold its forty-ninth annual meeting at Madison on January 11, 12, and 13. It is expected there will be a representative gathering of dairymen from all over the state, special attempt being made to secure representation from the 115 cow testing associations now in operation. The last day will be largely devoted to testers and special cow testing association problems.

There are many attractive and unusual features fixed on the program. The afternoon of the first day will be devoted to discussions of tuberculosis and there will be a practical demonstration of the three tests, how they are applied and how interpreted. In addition there will be a post-mortem of a reacting animal to show how this is done and where tubercular lesions are most often found.

On the afternoon of the second day there will be a discussion of practical feeding problems which will be followed by a trip through the stables to observe the results of Professor Hart's interesting investigations and feeding trials. It will offer a splendid opportunity for dairymen to see the results of improper feeding and how science explains them. They will see cows that abort because of deficiencies in their feed and they will see how a ration of dry feed and silage when supplemented by turnips or rutabagas will make milk production

NEBRASKA DAIRY JUDGING TEAM, 1920

Reading from left to right: G. A. Milby, W. T. Gray, C. Rydberg, Professor B. H. Thompson, Coach. This team stood highest in judging Guernseys and won the Guernsey cup at the National Dairy Show.

increase. No brief announcement can commence to indicate the great value of this one session alone, and the above outline is only a small part of the interesting experimental work that will be seen.

During the week there is to be a milk campaign in progress in Madison and dairymen can have an opportunity of seeing how consumption of dairy products can be increased by proper publicity. Just now this should be of special interest to dairymen as they feel the pressure of lowering prices.

A strong list of speakers, including Professor Eckles of Minnesota, has been secured. Dairy farmers, busy though they are, can well afford to attend. Room reservations will be made and programs supplied on request to A. J. Cramer, College of Agriculture, Madison.

An informal meeting of the Wisconsin Dairy Council will be held at the Park Hotel on the evening of the tenth. Important matters of vital concern to the dairy industry will come before this meeting and it is hoped that as many as possible will arrive in Madison to attend this session. PAUL C. BURCHARD, Sec.

Removed From Accredited List

Since the beginning of the work three years ago, the United States Department of Agriculture has removed 74 herds of cattle from the list accredited as being free from tuberculosis. The presence of one or more reactors was the cause for removal. The number of herds taken off the list is small compared with the total number of accredited herds, which now exceeds 4,000. The Federal Bureau of Animal Industry makes it plain that the list includes the names of only those persons who keep tuberculosis out of their herds.

Reactors Found in Most Cases

In most cases where reactors were found among cattle which had passed the requisite number of official tests, reinfection was traced to carelessness. Either the accredited animals had been permitted to run in pastures with infected cattle or else animals of doubtful health had been brought on the premises and stabled with the others. This is in violation of the agreement which the owner signs when he applies to have his herd tested. In one instance a breeder with an accredited herd purchased an entire herd whose history he knew little about. About half of the animals bought reacted to the tuberculin test when it was applied. But instead of segregating for a time those which did not react, he immediately added them to his officially accredited herd. This was one of the herds taken from the list following the discovery of several reactors.

"The breeders must realize," a bureau official declared, "that if they take chances, tuberculosis is likely to gain a foothold again and if it does the herd can not stay on the list." In only 5 instances out of the 74 "discredited" herds the presence of reactors could not be explained. This is considered a small number in proportion to the nation-wide extent of the work. Where only one reactor is found in an accredited herd it is possible for that herd to get back on the list again within 6 months if a retest at that time shows the herd to be clean. When several reactors are found it takes from a year to a year and a half for the herd to again become accredited. In all cases reactors must have been removed.

There is increasing evidence also that cattle which, though not reactors, are "suspicious" should be looked upon as a constant source of danger. Frequently the disease is so far advanced in such cattle that they fail to respond to the test yet are more dangerous to the herd than some reactors. Suspicious animals can not be officially condemned, but breeders who are familiar with the situation sometimes permit them to be slaughtered rather than jeopardize the health of other animals.

Guarding Animals at Shows

"Another important precaution in tuberculosis-eradication work," the bureau official added, "is the showing of cattle at fairs and exhibitions. Owners of accredited herds are now demanding that such herds at least be kept in separate barns so that they will not have to mingle with untested cattle. Some fair associations have gone so far as to require a tuberculin-test certificate for all cattle shown. Another risk—and it is a serious one—is to buy cattle from herds you know nothing about. Even when such animals are tested and reactors are removed there is a risk that even those which pass the test are not all entirely free from recent infection, especially when the original herd may have been half diseased. It is much safer to purchase cattle from a breeder who is known to have healthy stock."—U. S. Department of Agriculture.

Butter Market Steady

[Report by U. S. Bureau of Markets]

Taken as a whole, butter markets showed a little improvement during the week ending December 11. Since the sharp declines at the close of the previous week, prices on fancy butter have held and even slight advances were registered in some markets.

Arrivals of Danish butter were heavy during the week, but the rumor prevails that Great Britain is contracting for larger quantities of Danish butter for delivery after the first of the year and that will lessen the exports to the United States. Holders of Danish butter were inclined to move this butter as rapidly as possible even at much lower prices now current. Some of the last arrivals have developed mold.

Holders of storage butter refuse to discount the market and withdrawals continue short of last year. A fairly liberal surplus over a year ago is expected when final reports are completed.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending December 11, 1920, and the corresponding week last year were as follows:

	Week ending Dec. 11 1920	1919
	cents	cents
New York	52.75	73.20
Chicago	48.33	68.70
Philadelphia	52.91	73.00
Boston	52.00	72.80
San Francisco	48.33	65.20

The receipts of butter at these markets for the week were 6,196,354 lbs. as compared with 5,587,963 lbs. a year ago and 5,827,104 lbs. last week.

Cheese Market Lower

[Report by U. S. Bureau of Markets.]

Prices took an unexpected tumble during the week ending December 11, but there was little activity. Unless goods begin to move better, further price concessions are not unlikely. Some dealers in Wisconsin report carrying over as much as 75% of their current week's receipts. Dealers who have fancy holdings in storage, however, are not particularly alarmed as there remains 4 to 5 months in which to move it. Holdings are not excessive and consumptive demand so far is good.

The average wholesale prices on American cheese (style Twins) for the week ending December 11, 1920, and for the corresponding week last year were as follows:

	Week ending Dec. 11 1920	1919
	cents	cents
New York	27.58	31.50
Chicago	23.54	30.93
Boston	25.25	32.75
San Francisco	27.50	30.49
Wisconsin Boards	20.95	30.69

The receipts of American cheese for the week at the four markets first mentioned and at Philadelphia totaled 2,557,052 lbs. as compared with 2,766,272 lbs. a year ago and 3,376,193 lbs. last week.

The good old custom of reading aloud under the evening lamp is an antidote to many forms of present-day restlessness.

Uncle Ab says: Only a lazy man wants an easy job; the hard jobs are the ones worth doing.

J. E. STALLARD, GUERNSEY FIELDMAN WHO WILL WORK IN THE MIDDLEWEST

The Dairy Farmer and the Farm Loan Act

GUY HUSTON, ILLINOIS

HOW can the farm loan act help the dairy farmer?

Any system of finance which can make readily and easily available money at low rates of interest and on convenient time can help any farmer who desires to expand his operations or install improvements.

This article is not so much intended to tell the dairy farmer what to do with his money when he gets it as it is intended to show him how and where he can get the money.

To be sure, the purpose to which borrowed money is to be put usually governs the length of time the loan is to run and often determines also the rate of interest. However, the general influence of the farm loan act upon country banking is to give a greater degree of elasticity to the whole business of farm credits, so that the farmer who needs money can get it in whatever amounts his credit and standing warrant. Under these new conditions, as we shall see, the farmer is better enabled to finance himself in almost any undertaking, whether it be erecting new buildings or buying sires and new female stock.

Many farmers have felt the need of short-time credits more than they have felt the need for the long-time loans. These will be interested in a study of how ample and convenient provisions for long-time loans as contained in the farm loan act have a direct and helpful influence upon the short-term credit situation.

Those who borrow of the land banks created or authorized by the federal farm loan act are given 33 to 35 years in which to repay the principal. The loans are made on the amortization plan, and the annual or semi-annual payments are small, amounting to only 1% of the face of the loan. The rate of interest is low. The rate cannot exceed six per cent, but if interest rates in general should be reduced, the borrower has the privilege and the right to pay off his loan negotiated at the higher rate of interest, and to refund it at whatever low rate of interest may prevail at any time after the fifth year.

By these generous provisions, many of the irksome conditions which hitherto have accompanied the making of loans on land mortgages have been removed. The farmer who makes a long-term amortized loan is in a much more comfortable position than if he had made a loan running three to five years. He knows that he can meet at each interest-paying period the small additional payment required as an installment to be paid on the principal. And he knows that if he meets these small annual or semi-annual payments he is in no danger of a foreclosure.

The money for the long-term loans is supplied from the wholesale money markets in the great commercial centers. In other words, it is outside money which has come in to carry the farm mortgage loans. The local banks are relieved from the burden of carrying the long-time indebtedness, and consequently a larger proportion of the local funds are available from which to make short-term loans than would have been available had not these long-time loans been cared for by outside capital.

In a word, much local money which, under ordinary circumstances, would be invested in farm mortgages becomes at once available for short-term loans.

One of the difficulties in financing agriculture has been the inability of the local banks to supply adequate funds. Heretofore, they have been called upon to find money to lend on farm mortgages quite as well as to find the money with which to buy live stock or machinery, or with which to erect buildings. The ability to supply ample funds for short-time loans for use in productive operations has been limited automatically by the amount of local money available for all purposes. During the three years that the farm loan act has been in operation (and the farmers have not made nearly so large a use of it as they should have made) a considerable improvement in short-term credit conditions has been noticed.

CALIFORNIA DAIRY PRODUCTS JUDGING TEAM THAT WON FIRST PLACE IN THE PACIFIC INTERNATIONAL LIVE STOCK SHOW

Standing, left to right: G. R. Jaehnig and E. C. Spainhower. Front row: L. H. Nielson and G. D. Turnbow, coach.

G. R. Jaehnig and L. H. Nielson won first and second places in the judging of all products and also won first and second places in the judging of cheese. Mr. Nielson also received first place in the judging of milk.

Take the state of Iowa—in three years the farmers of Iowa have borrowed forty-seven millions of dollars of the banks operating under the farm loan act. This means that Iowa farmers have secured forty-seven millions of dollars under conditions which will give the borrowers 33 to 35 years in which to pay off this debt. Doubtless a considerable part of this sum was devoted to the re-financing of old indebtedness formerly carried on mortgages given to life insurance companies or to great estates or savings banks engaged in the practice of lending money on land mortgages. However, also, a considerable portion has been devoted to the re-financing of loans that were made by farmer to farmer, by father to son, and by seller to buyer. These old loans made between local parties often involved only a small amount of actual cash, the seller accepting a part payment (often a small payment) and taking a note and a mortgage for the remainder. Under the new plan the seller gets his money because the same is advanced by a joint stock land bank or a federal land bank, and this money so advanced he can put into the local bank or lend out on notes secured by chattel mortgages, or possibly on notes given by men whose credit is such as not to require a chattel mortgage.

The point of all this is to show that the re-financing of the farm mortgage loans on the long-term plan does increase the amount of local capital available for the ordinary local purposes of local banking.

Now we are very near the point where we can see how the farm loan system can help the dairy farmer. With more local money available, the banker is more nearly able to supply the needs of all the borrowers of good credit who apply to him.

Right at this point, it is well to consider that the farmer who has been alert enough to place the loans on his land through the banks of the farm loan system where the annual payments are small and surely within his ability to meet, even in the lean years, is a much better financial and moral risk from the standpoint of the local banker than the farmer who has to struggle along with a five-year mortgage hanging over his head, which necessarily involves either the payment of a large sum within a comparatively few years or the re-financing of the loan with commissions and abstract and appraisal charges taking a large part of his legitimate earnings which otherwise might be used in financing his farm operations.

The farmer who has the loan on his farm placed under conditions so that he can handle it comfortably is in a much better position to secure a short-term loan from the local banker for seasonable operations.

In making a loan, the banker's first duty is to his stockholders. He must make sure that the borrower is able to repay the loan promptly. It is not enough that the security should be ample. The banker does not care to become a merchant, or an auctioneer, selling the things he has had to take over on defaulted notes. What the banker wants is the money. Therefore, he wants to know that the farmer to whom he lends is in a position to pay promptly when the loan falls due. The banker must know, in the case of the farmer, just as he must know in the case of a merchant, that the borrower will have the money when it is due. He must know what the borrower's income is likely to be, and he must know what if any other demands the farmer must meet. He cannot be a safe banker and be lax about these things. It is not his own money he is lending; he is a trustee of the funds of the community. Therefore, the stockholders and the depositors (and the government) require that he shall exercise great care in making loans.

Knowing this, the borrowing farmer will readily understand that if he has his mortgage loan in the farm loan system, where there are no commissions and no renewal charges, and where he has 33 to 35 years in which to repay the principal in small annual or semi-annual payments, the banker can be reasonably certain that a short-term loan made to buy live stock or to erect buildings will be repaid promptly, because the farmer will not be harassed by having to meet uncertain demands in connection with the mortgage on his farm. A farmer who carries his mortgage loan in the farm loan system is entitled to get money at the local bank when he needs it to buy a bull or additional cows, and to get it for the length of time he requires it, because the banker can tell with satisfactory accuracy the ability of such a farmer to meet his obligations.

Thus, we see that the two benefits which may come to the dairy farmer (or any other farmer) from the farm loan act are these: First, an increase in the amount of local capital available for short-time loans; second, a considerable improvement in his own condition and his own financial standing as a borrower at the bank.

Here, then, is a considerable relief in the field of short-term credits.

Still another advantage which comes to the farmer who makes use of the farm loan system may be found in the fact that often the farmer may use the money which he borrows on his farm as operating capital. He may use it to build up his herd, to buy sires, or blooded female stock. He may use it to improve his plant, to install water and light, to build new barns, new silos, to erect windmills or power plants, or to buy milking machines, or whatever is required to expand his operations.

True, the farmer who takes advantage of the farm loan system to borrow the money which he intends to use as working capital may not have constant use for the entire amount he borrows. He may have an accumulation of idle funds at certain seasons of the year, while at other seasons the entire amount will be employed. And, of course, it is evident that he must pay the land bank 5½ or 6 per cent throughout the year for the entire amount he borrows, whether it is all employed all the time or part of it is idle part of the time. What then is the farmer to do with his idle funds? Well, what does the merchant or manufacturer do with his idle funds? The city business man deposits his idle funds in the bank, and the bank pays him interest on his daily balances. Is not this, then, the practice for the farmer to follow? True, he will be paying 5½ or 6 per cent to the land bank and will be receiving only 4 per cent, perhaps, from the local bank. This looks like a loss; and it is. But it is only for a few months of the year, and the loss of 1½ or 2 per cent is to be considered as a guarantee that he will have the money when he needs it. Of course, if the farmer cannot make this borrowed money earn him more than 6 per cent, then he ought not to borrow working capital. But if the farmer can borrow money at 6 per cent and use that money in such a way as to make it pay him 10 per cent or 20 per cent when he sells his crop or his milk or his live stock, then he is warranted in borrowing working capital, and need not worry his head off about a loss of two per

(Continued on page 1048)

EDITORIAL COMMENT

MUCH complaint has been entered of late against the profiteer and speculator. It is generally agreed that they have no place in our economic system as they do not contribute to the building of our country. While we all agree on this there seems to be a disagreement regarding the keeping of poor cows. Just why should any person keep cows that do not return their cost of feed? Who forces farmers owning such cows to keep them?

"I HAVE no sympathy with any farmer movement that proposes to corner or establish monopoly prices on food products but we demand the right to be allowed to market our crops in an orderly way and as the consumer wants them." This is the succinct remark of J. R. Howard, President of the American Farm Bureau Federation before a bankers' meeting in Chicago. This brief statement enunciates a great principle to be followed by all farm organizations if they expect to be successful. It is recognized by Mr. Howard and every other clear thinker on farm topics how utterly futile it would be, even if it were right, for 6,000,000 or more farmers to attempt to form a monopoly for the purpose of cornering farm products and fixing monopoly prices. Such a thing cannot be done. It would not only be a waste of time to attempt such an undertaking but it would lead to destruction the organization which entertains any such idea. It should be the purpose of every farm organization to improve methods of marketing, to lessen cost of production, and to eliminate wrong and evil economic practices.

COST OF PRODUCING MILK

The Dairy Division of the United States Department of Agriculture has made a rather detailed study of the cost of producing milk. In a recent bulletin setting forth the information regarding the cost of producing milk it is shown that 56.4% of the total cost of producing milk was for feed and bedding, 23.5% for labor, 17.6% for other costs, and 2.5% for depreciation. The requirements for producing 100 lbs. of milk during the winter were: Concentrates, 29.4 lbs.; dry roughage, 92.9 lbs.; succulent roughage, 143.3 lbs.; bedding, 9 lbs.; human labor, 1.0 hours; horse labor, .1 of an hour; other cost, $.576.

The statement is made that during summer, milk could be produced at much less cost, there being required comparatively small quantities of concentrates. It is well for dairy farmers to consider these figures for it will emphasize how essential it is to keep efficient cows. No farmer can ever expect to make a profit on a cow that produces 150 lbs. of fat in a year. If such a cow were ever to become profitable there would be such an overproduction of milk by the better class of dairymen that the market would be literally flooded and prices would go to everlasting smash-up.

BUY A BULL

This is the time to buy a bull. Prevailing prices are the lowest in many months. In recent public auctions and at private sale, pure-bred dairy sires have sold for little more than their beef values because of a greatly weakened demand. One who visits many breeding farms says of the bulls for sale: "The woods are full of them".

Bulls aren't going out of style in dairy herds. Fully as many are needed as ever. The present slack sale for them is the result of a determination among buyers to wait for still lower prices. The bull calf which they planned to buy last fall and raise for use a year from now has not been purchased. On some farms cows which should now be in calf have been allowed to "run over" because the owner is waiting before buying a bull. When the demand is good, prices are high; when there is the least buying, values are low. This is the time to buy. Prices may make still further declines, but those at present are surely favorable. It is quite as likely good sires will not be cheaper. Certainly it is expensive to wait longer if a bull is needed now.

Especially is the time opportune for the owner of a grade or scrub bull to exchange for a pure-bred. The bologna market will pay nearly as much for his sire as is required to purchase one with a production pedigree. Particularly is this true if a mature bull is to be disposed of and a pure-bred calf secured. The man who has excused the use of a nondescript bull on the claim that "pure-breds cost too much" need wait no longer. This is the time to buy a bull.

TUBERCULOSIS A PRIVATE AND A PUBLIC QUESTION

The eradication of bovine tuberculosis from dairy cattle is both a public and a private question. It is a public question in so far as it affects public health and a private question in so far as it affects the owners of cattle and their profits. The public has a right to demand that their dairy products come from healthy cows and it is the duty of those who own cattle to carry out the necessary provisions to free their herds from tuberculosis.

Since the public is concerned in eradicating tuberculosis from all dairy herds, it is only fair that it bears a liberal portion of the expense incurred by the elimination of animals suffering from tuberculosis. The owner should bear a part of the loss, because it is important to him that his herd be free from disease. A cow suffering from infection requires more feed to sustain her and produces less product. The owner is constantly sustaining losses both in production and from the death of animals when tuberculosis is present. Since he profits by having a clean herd he should bear at least some of the expense when an animal is slaughtered. There is still another reason why the owner should bear some of the expense. If he bore none of the loss when his animals were destroyed there would be less incentive for the owner to exercise the care necessary to keep his cattle free from tuberculosis.

The federal government and the state governments should be more liberal than they ever have been in paying for condemned animals. In the first place, we believe the owners are entitled to a more liberal compensation; and, secondly, a larger indemnity would encourage eradication of tuberculosis, which is highly desirable to both producers and consumers.

LAWS AND WORK

Those who are looking for laws to bring relief to our sick nation have not given our situation serious consideration. Laws cannot correct conditions brought about by extravagance, over-expansion in business, and waste. Laws may be enacted which will provide more equal opportunities, and assist in suppressing evil practices in business, but they will not grow crops or distribute them; build homes; manufacture clothing; or build railroads. Those who think laws can be passed that will heal up the wounds of the nation are doomed to disappointment.

The nation is very much in the same position as a young man who buys a farm and is able to make but a small payment on it. We all know what this young man must do to clear his farm. He cannot pay his debt by complaining about it or talking about what his neighbors should do or by waiting for the government to help him. If he is a wise young man he will belong to some farm organization whose business it is to look after the welfare of agriculture. This must be done or the farmer will continue to receive the short end of the evener. But the young man's efforts must be put forth in the operation of his farm. He must work with a vengeance and apply himself intelligently. So with the nation we must delegate to those in whom we have confidence the power of running our government and business affairs, but we ourselves must go to work.

We are suffering from too many ideas; we have too many cracked brain would-be savers of the country, and all they have been able to do is to create confusion. Work—plain, every day work—with hands and head, and not laws, is needed to restore our industries as well as ourselves to normal. Let service be our New Year's resolution.

CHEAP FOOD AFFECTS ALL

The decline in prices of farm products was hailed with delight by those who purchase them. It seems to many that if food and clothing could be purchased cheaply the solution of the high cost of living and for making a fortune would be solved. These people forget that agriculture is the basic industry of the nation, that unless farm products bring a good price the laborer of the city cannot expect to receive good wages, and the manufacturer cannot expect to sell his commodities. It is estimated that the shrinkage in prices of farm products has amounted to between six and eight billions of dollars. This means that the farmers will have just that much less money to spend for necessities, luxuries, etc. When the farmers' purchasing powers are decreased the purchasing powers of others are likewise decreased. What is there to be done about it? Farm organizations are taking more interest in economic questions, in legislative matters, and in activities of all kinds than ever before. This is a healthy situation, for in the past the farmer has not had as active a part in guiding industry, in making laws, and in various other ways as he should for the good of the nation or for the good of agriculture.

We welcome the new attitude which the American farmer is taking of all things public and especially towards his own business. Through this effort, organized as it is, the laborer, the manufacturer, the merchant, and the banker will be led to see that if we are to have a prosperous nation its fundamental industry must be prosperous. Cheap food and clothing means cheaper wages in the cities and much idleness until industry can be adjusted to the new order of things.

THE COW THE BEST MARKET

The dairy industry has not suffered decline in the prices of its products as much as some other branches of agriculture. The dairy industry has always been able to hold an enviable position during a crisis of a readjustment period.

The condensed milk industry had a severe setback when foreign demand for its product ceased, but this industry takes less than 5% of our total milk supply. The prices of mill feeds and by-products have fallen at least 50%. Oil meal which was worth $90 or more a ton last year can now be purchased for less than $45 per ton. Cottonseed meal is cheaper than oil meal. Bran is selling for less than half of what it was a year ago, while the price of market milk has decreased between 30 and 35 per cent, butter about 23%, cheese from 25 to 30%, and cows about 40%. The demand for good butter is greater than the supply.

So far as the prices of mill feeds are concerned the dairyman is in a better position for making a profit from his cows this winter than he was a year ago. We believe the future for the dairy farmer is quite as bright for making a profit during the coming months as it has been in the past. This is no time for the dairyman to lessen his efforts in the improvement of his herd and equipment or practice economy in feeding his cattle. Every effort should be put forth to build up a high producing herd of cows and then provide them with adequate rations for making milk.

The cow offers a better market today for farm products than can be found anywhere else. Good business demands that farm products should be sold to the market that brings the largest returns.

Curing Pork

In one of your 1919 issues you gave a recipe for curing pork in liquid form. I used it last year and found it fine, but have lost the recipe and would appreciate it very much if you would be so kind as to give it to me.

Capelville, Tenn. R. T.

The formula for curing pork by the brine method is as follows: For each 100 lbs. of meat use 8 lbs. salt, 2½ lbs. sugar or syrup, 2 ounces saltpeter, and 4 gallons of water.

In warm weather 9 or 10 lbs. of salt is preferable. Allow 4 days' cure for each pound in a ham or shoulder and three days for bacon and small pieces. For example, a 15-lb. ham will take 60 days; a piece of bacon weighing 10 lbs. will take 30 days.

The brine should be made the day before it is used, so that it will be cool. All the ingredients are poured into the water and boiled until thoroughly mixed. Place ham on the bottom of the container, shoulders next, bacon sides and smaller cuts on top. Pour in the brine, and be sure it covers the meat thoroughly. In five days pour off the brine and change the meat, placing the top meat on the bottom and the bottom meat on top, then pour back the brine. Repeat this operation again on the tenth and eighteenth days. If the pickle becomes ropy, take out all the meat and wash it off thoroughly, also the container. Boil the ropy pickle; or, better, make new pickle. When each piece of meat has received the proper cure, take it out of the pickle and wash it in lukewarm water, string, and hang in the smokehouse.

Choosing Cattle Names

What is the system used in naming registered cattle of the dairy breeds?

Mulvane, Kansas. W. W.

There is no system in universal use in the naming of cattle for registration. Each owner has worked out the plan which seems to suit him best.

In some cases, a prefix is used which gives the name of the owner, the name of the particular family of the animal, or the name of the farm. Another identification in the name is the one most commonly in use of giving a portion of the dam's or sire's name—sometimes both. The practice is made in some herds of giving new animals names which begin with the same letter as do the names of other animals within that particular family in the herd. For example: A local farm may call a cow within a certain family "Ivy of Koshkonong". In the same herd, closely related animals will be found to have names beginning with the letter "I".

Velvet Beans in Ration

Is it possible to make a properly balanced ration for dairy cattle out of velvet bean meal, corn cob meal, alfalfa hay, and ensilage? If not, what should be added to it and why? Is it possible that this is too heavy and heating a diet?

Nashville, Tenn. B. R. P.

The two roughages, alfalfa and silage, if of high quality, give a very good basis for feeding. Combining the velvet bean meal and corn and cob meal should give a profit from dairy cows. We would mix these two concentrates in about the proportion of 300 lbs. of corn and cob meal to 100 or 150 lbs. of velvet bean meal. There is some advantage in adding other feeds to this mixture for the variety secured, but this mixture alone should give good results. Grinding the cob with the corn lightens the mixture and makes it much easier to handle than if velvet beans and shelled corn were ground together, in which case it would be necessary to use ground oats or bran to lighten up the mixture.

A Well Question

Our well is 28 feet deep and about 3 feet of water is as much as there ever is in it. Quick sand keeps coming in and leaves less reservoir room. I have wondered if a 4-inch monolithic silo about 4 or 5 feet in diameter might be sunk deeper as a whole and if it could be let down until a slate or a hard substance would be entered into. Do you think that this would prevent sand from entering?

A neighbor has a 90-ft. deep drilled well and it is not sufficient for watering much live stock. How deep need one go and what might be the possibility of getting an artesian well or a liberal supply with a drilled well?

Birmingham, Ohio. J. J. L.

It would be impossible to say just what veins of water you would be likely to strike in digging a well deeper unless one is very well acquainted with the geology of the surrounding country. I do not believe that you would be justified in going to the trouble and expense of constructing a portion of a concrete silo in your well to keep back the quick sand which fills it up from time to time. I would suggest that you secure several joints of 36-inch bell end sewer pipe for this job. It is true that one cannot work very well in a 36-inch space, however one can use a short handled spade and a digging iron if the digging iron becomes necessary. If you dig the hole deeper other joints of 36-inch sewer pipe may be added on as deep as you care to carry the well. These joints in the sewer pipe might be sealed up with a very weak mortar made of one part of cement to about four or five parts by measure of sand. Water will penetrate such a cement mortar.

I have seen other curbs used instead of the sewer pipe; however in a short time this material will decay and allow the quick sand to fill the well again.

Pa. College of Agr. R. U. BLASINGAME.

Casein for Skimmilk

Kindly inform me which is the best and most profitable way to extract casein from skimmilk.

Mount Vernon, Wash. E. R. K.

There are two principal ways of extracting casein from skimmilk, one is by the use of sulphuric acid and the other is by the use of sour whey or rennet. The product of the first process is called acid casein and the product of the second process is called natural casein. Most of the casein manufactured is acid casein and the demand for the natural casein is very limited in this country.

Manufacture of Acid Casein—Use a wooden vat of suitable size. Run the skimmilk into this vat from the separator and heat the skimmilk in the vat with live steam to 130 degrees F. Then add slowly one pint of crude sulphuric acid (strength 66%) to each 1,000 lbs. of skimmilk. Distribute this acid over the entire vat when adding, stir the skimmilk thoroughly until curdled, then drain off the whey, using a strainer covered with cheese cloth so as to retain any fine particles and prevent their loss. Now rinse the curd with cold water. This can be conveniently done by turning a hose on it. Press this washed curd and grind it, using a peg mill similar to the cheese curd mill and then dry the curd.

The drying is done by spreading the ground curd on trays which are placed on shelves in a drying chamber, which simply consists of a room or vault with steam pipes.

In the drying of the curd, care must be taken that the temperature is not excessive. The temperature of the drying chamber should be held down to a temperature of 120 to 125 degrees F. Exposure of the curd in the drying room to excessively high temperature causes it to become dark and otherwise injures its properties for commercial purposes.

The trays on which the ground curd is placed for drying usually consist of wooden frames covered with fine wire screen about as fine as mosquito netting. The screen consists of galvanized iron wire. These trays or sieves are made of convenient size and are placed on top of one another and the curd is spread on these trays from about one-fourth to one-half inch thick.

In the drying room the heat is supplied by means of running steam pipes along the walls or elsewhere. The presence of one or more fans in this room greatly hastens the drying process. Some manufacturers of casein use a specially built drying closet built of such width and height as to accommodate two rows of trucks loaded with curd trays. These kilns may be about five feet wide, from ten to twenty feet long, and about five to six feet high. A fan draws a current of hot air through a steam radiator and blows this hot air over the trays on the trucks. It usually takes from twelve to twenty-four hours to accomplish the drying at 120 to 125 degrees F.

In some cases it is desired to pack the curd wet and to ship it to the buyer in this condition. In this case it is best, after washing the curd, to cook it in hot water at a temperature of 165 degrees F. or higher until it mats together and practically fuses into a mass like a very heavy dough. When this condition has been reached, the water is strained off and the curd is turned over and sufficiently manipulated with shovel or rake so that it drains well and that the matting together into one mass is complete. The wet, cooked curd is shipped in sacks or barrels. The cooking and matting of the curd has for its purpose the prevention of mold in this wet curd.

Sour curd may also be made by allowing the skimmilk to sour and then proceeding in similar manner as above described but without using any sulphuric acid, but the process is considerably slower and the curdling action is less complete.

Manufacture of Natural Casein—Place from two to three inches of sour whey in a vat, then run the skimmilk into the vat. The whey not only acts as a starter because of the acidity it contains but it causes the skimmilk to curdle because of the action of the rennet which was used in cheese making. Heat the contents of the vat to 150 degrees F., then stop heating. Allow the milk to stand a few hours and again bring the temperature to 125 degrees F. When the curdling is completed stop the stirring and allow it to cool. When the batch is cooled, run off the whey. In case the milk does not curdle thoroughly repeat the above operation. This is usually not necessary during warm weather, but may have to be done in winter. After the whey is drawn off treat the curd in the same manner as stated under acid casein.

The acid casein made by the use of sulphuric acid represents by far the most practical and most rapid process of making casein for industrial purposes, and this casein when properly made dissolves readily in any alkali and has many commercial uses, while the market for rennet casein is relatively limited. O. F. HUNZIKER.

Milk or Cream

We have a herd of 28 Holstein grades and registered, selling whole milk to condensery, getting only $2.10 per hundred for 3.5% milk, less 25c per hundred for hauling. I have thought of quitting selling to the condensery and separating our milk, feeding the skim to a big bunch of late fall pigs and calves, selling the cream once a week to a dealer in town for 45 to 55 cents per pound. Which operation would be the more profitable, taking into consideration the present price of grain?

Pearl City, Ill. H. J. H.

With the creamery dealer paying 45 cents per pound for fat, there would be a return of $1.57 for cream in 100 lbs. of 3.5 per cent milk. The actual amount might be slightly less than this owing to either a slightly lower test of milk or to a possible loss in separation; however, this latter should be inconsiderable if the separator is correctly operated and in good condition.

For feeding hogs, skimmilk is valued at one-half of the price of a bushel of corn. With corn selling at 80 cents per bushel, this would make skimmilk worth 40 cents per 100 lbs., and 100 lbs. of milk will yield approximately 85 lbs. of skimmilk. This skimmilk would then be worth about 35 cents, making a total return of $1.92 on 100 lbs. when the milk is sold as cream.

In this computation we have assumed that the price of 45 lbs. of fat is net with no deductions for hauling. While it would be proper to add some charge for the use of the separator and the time spent in separating, this would be an inconsiderable amount if a good quantity of milk is produced.

The present net price for whole milk is $1.85, which would mean that the cream separation would give 7 cents more per 100 lbs. for the milk. If the butterfat sells for 55 cents, the return from the sale of cream would be $2.27, or 42 cents more than is received for milk at the present time.

If the skimmilk is to be fed to calves of good quality and for which there is opportunity of sale at attractive prices, we believe one can count on a better return than we have computed for skimmilk. There is a possibility, of course, that eventually there will be a better price for whole milk than at present, but if this should prove to be true or if the butter market should be considerably lower, then it would be still possible to change back to the whole milk method of selling.

In calculating the comparative profitableness of the two methods of disposal, merely multiply the test of the milk by the price received for butterfat and then add to this one-half of the value of a bushel of corn, deducting any charges for cream hauling that there might be. Compare this price with the net price the condensery would pay. There are, of course, other factors to be considered, chief of which is the value of skimmilk in growing calves that will appeal to the buyer and that can be sold at relatively better prices. There is also the tendency in all condensery districts not to raise calves to maturity. This we consider a somewhat faulty practice. Indeed many of our dairy farmers find the sale of their surplus cattle one of their largest items of income.

Uncle Sam's Hired Men Who Serve You

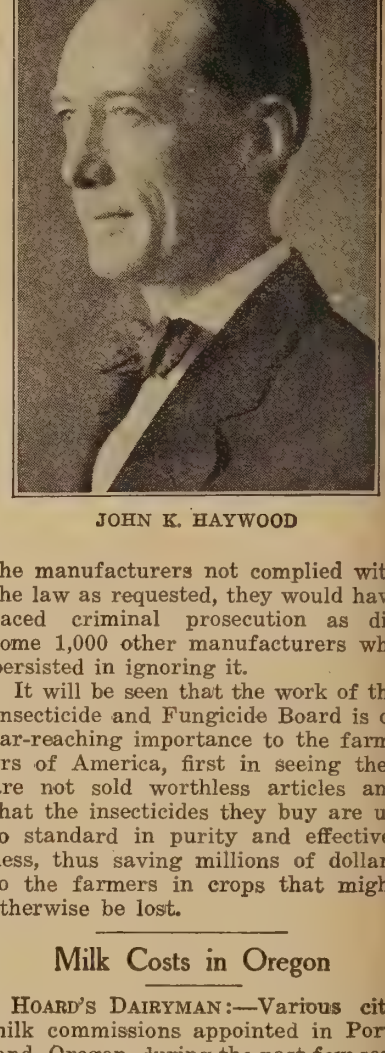
Dr. J. K. Haywood, Chairman of Insecticide and Fungicide Board, Saves a Billion and a Half a Year to Farmers

DIXON MERRITT

This is the tenth of a series of articles this publication is running, in co-operation with the U. S. Department of Agriculture, to acquaint our readers with the type of men who are making possible the wonderful service the department is rendering and stands ready to render our readers, that those not now availing themselves of these services may do so.—EDITOR.

MAN'S most dangerous enemies are the insects. The smallest things in the visible creation, they are capable of such tremendous increase and expansion that uncontrolled they would exterminate the human race in short order. The larger part of control comes from the operation of that mysterious thing that scientists call the balance of nature. In plain language, that law is that every form of life sustains itself by preying on other forms of life, and thus all forms together hold each form in check. That law in operation would prevent the destruction of the human species by insects, but it would not prevent almost intolerable damage to man himself, to his live stock, and to his crops. Scientific control, added to natural control, enables the farmer in very large measure to save himself from the ravages of the insects, and, in the aggregate, makes possible the production of billions of dollars of wealth in the United States each year that otherwise would be destroyed by pests.

Twenty-five years ago the United States Department of Agriculture brought from the experiment station at Cornell University a young chemist, John K. Haywood by name, and put him to work in the Bureau of Chemistry doing a number of things in relation to stock feeds, mineral waters, and other subjects equally widely separated. Before he left Cornell he had tried to make an analysis of Paris green and found that no definite means had been discovered for analyzing insecticides. When he came to Washington he confirmed his previous opinion. A few people had examined a few insecticides, but there was no branch of chemistry that could be called insecticidal chemistry. Prior to that time there were men recognized as agricultural chemists whose work had to do with feeds, fertilizer, and chemistry in relation to the growth of plants, but none of them was even expected to know why any preparation was or was not an insecticide or fungicide. Haywood started out to develop an insecticidal and fungicidal branch of chemistry. How well he has succeeded is shown by this fact: When he began his work, any man undertaking to write a book on chemistry could not have filled a single page with any degree of accuracy on insecticidal chemistry. Today no man could write a book on agricultural chemistry without devoting at least a full chapter to insecticides and fungicides.



All food crops, all live stock, and the great cotton and tobacco crops are subject to the ravages of insects and diseases. The animal crop loss from insects and fungi in the United States is estimated to be in excess of $1,500,000,000. What the losses would be without insecticides and fungicides of sufficient potency to kill the bugs no one dares to approximate. Insecticides and fungicides are, therefore, as necessary a part of farming as fertilizers, or even plows and cultivators. In addition to seeing that the insecticides and fungicides on the market—preparations that have a commercial value of some $40,000,000—are not misrepresented, the Insecticide and Fungicide Board performs a conspicuous service in assisting manufacturers to perfect preparations that will adequately protect crops from insects and diseases. Thus millions of dollars' worth of farm products are saved annually.

The most recent contribution to the nation's welfare along this constructive line has been Dr. Haywood's work in connection with calcium arsenate, the only effective agency in combating the cotton boll weevil, an insect that destroys millions of dollars' worth of cotton annually. The Bureau of Entomology had developed this insecticide in an experimental way. Dr. Haywood carried out the work on a commercial scale. He perfected a commercial process of manufacturing calcium arsenate and contributed it to public use. Now manufacturers of calcium arsenate are using Dr. Haywood's process. In the past two years 13,000,000 lbs. of calcium arsenate of a value of $2,600,000 have been manufactured, and it is estimated that the manufacturers will put out twice that quantity next year. The fact of greatest importance, however, is that an effective control of the cotton boll weevil has been developed. Just how much of the cotton crop has thereby been saved can not be estimated, but 10,000,000 pounds of calcium arsenate, enough to treat 2,000,000 acres of cotton, was shipped into the cotton belt during the past season.

There was urgent need for legislation to safeguard the public from fraudulent preparations, and Dr. Haywood initiated the work of fostering and organizing the sentiment that culminated in the passage of the Insecticide Act of 1910. This law, the first draft of which was prepared by Dr. Haywood, prohibits the manufacture, sale, or transportation of adulterated or misbranded insecticides and fungicides intended for use by the farmer, orchardist, truck gardener, and animal and poultry raiser, in combating and controlling insect pests, plant diseases and bacterial and parasitic diseases of animals. The law also covers disinfectants and insecticides used in the home and in public places.

The Department of Agriculture's Insecticide and Fungicide Board, which directly administers the act, is composed of three scientists in addition to Dr. Haywood—Dr. M. B. Waite, pathologist in charge of fruit disease investigations in the Bureau of Plant Industry; Dr. A. L. Quaintance, entomologist in charge of deciduous fruit insect investigations in the Bureau of Entomology; and Dr. J. A. Emery, assistant chief of the Biochemic Division of the Bureau of Animal Industry. These scientists and their assistants have devised many new methods for examining insecticides and fungicides to determine whether or not they are adulterated, and for determining in the laboratory the probable value of the products in the field. The methods perfected have been published for the use of insecticide and fungicide manufacturers, and for the use of other scientists in testing such products. Considerable work has also been done with regard to the action of various insecticidal substances on vegetation and the action of various compounds and substances against insects and fungi.

The board has collected and examined nearly 8,000 samples of insecticides and fungicides. In some 1,400 official cases manufacturers were informed that the claims set up for their products were inaccurate. They were advised either to modify their advertising to fit the actual facts or to perfect their products to meet the advertising. To do the latter was quite impossible in a good many instances but there were also many cases where, with the assistance of the board, the preparations were made more efficacious than they had been before. The board might have prosecuted these 1,400 cases but it felt that possibly the manufacturers were honestly under a misapprehension regarding their preparations and gave them the benefit of the doubt. Had the manufacturers not complied with the law as requested, they would have faced criminal prosecution as did some 1,000 other manufacturers who persisted in ignoring it.

JOHN K. HAYWOOD

It will be seen that the work of the Insecticide and Fungicide Board is of far-reaching importance to the farmers of America, first in seeing they are not sold worthless articles and that the insecticides they buy are up to standard in purity and effectiveness, thus saving millions of dollars to the farmers in crops that might otherwise be lost.

Milk Costs in Oregon

HOARD'S DAIRYMAN:—Various city milk commissions appointed in Portland, Oregon, during the past few seasons by the mayor to settle milk distribution difficulties have been at a loss for a basis of procedure because of varying opinions on the cost of milk production. Without this information there seems to be no logical starting point for a sound economic decision.

The most recently appointed commission has appealed to the Oregon Agricultural College for aid and as a result the Farm Management Department, with the co-operation of the county agents in Multnomah, Clackamas, Washington, and Columbia counties, has instituted a cost accounting system on the farms of two hundred dairymen, fifty in each of the four counties. R. V. Gunn, farm management demonstrator, will devote nearly all of his time for the next several months to close supervision of this piece of work which is regarded as of unusual importance by those familiar with dairy affairs in the vicinity of Portland.

Oregon. F. L. BALLARD.

Cheese Factory Bookkeeping

A cheese factory is ordinarily a comparatively small business and the usual bookkeeping methods are not applicable even if the maker and manager were competent for this class of work, a condition that seldom exists. None-the-less, when the items of expense are guessed at or overlooked, definite losses are suffered and bad conditions of operation are continued in ignorance.

To meet the need of the cheesemaker the Wisconsin Experiment Station has recently issued Bulletin 321, "Cheese Makers Save by Figuring Costs." The authors, Sammis and Juve, present a practical and workable system that should interest cheesemakers. Residents of Wisconsin can secure a copy of this bulletin free of charge by writing the Agricultural Experiment Station, Madison. Residents of other states will be supplied at a cost of five cents a copy.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, DEC. 20—The fact that Congress has foregone the usual Christmas vacation and is remaining in session except for four days, December 23 to 27, is the best indication of the seriousness of the situation as viewed by the lawmakers.

Attention shifted suddenly this week from the financial proposals to the tariff. The War Finance Corporation reviver passed the House on Saturday, stripped of the last vestige of agricultural complexion, and now is back in the Senate for conference or acceptance of the House amendments. In the meanwhile, the House Ways and Means Committee decided on Friday to report on an agricultural emergency relief tariff bill, and in three days whipped such a measure into shape by steam roller methods, and reported such a bill.

The bill as reported provides for a tariff sufficiently large to be nearly prohibitive on wheat, flour, corn, peanuts, rice, potatoes, beans, onions, lemons, cattle, sheep, wool, mutton, and vegetable oils. It will be known as the Fordney Emergency tariff of 1921.

This measure is the culmination of a series of conferences in which it seemed to be determined that the relief afforded by the War Finance reviver would be slight and perhaps greatly delayed by the prospect of a veto by the President, and some time in getting the Finance Corporation under way, even should he permit the measure to become law. The embargo asked for by wool and sheep interests and others met strong manufacturing opposition as well as the statement from the State Department that such law meant serious treaty disturbances. The tariff plan seemed more workable and of quicker action, hence the bill as stated.

The bill as introduced fails to meet the approval of many persons and of many interests, not the least of which is the dairy industry which gets no relief of any kind from the bill as reported. A strong plea was made in committee by Representative Frear of Wisconsin and Representative Green of Iowa for the inclusion of butter but this, and a proposal to include frozen meats, evoked the positive statement from members of the committee that they would not stand for these items.

Representatives of dairy organizations put the butter tariff straight up to the committee and to other members of Congress as soon as the fact was known that a bill would be reported, but the attitude of Congressman Longworth of Ohio, Treadway of Massachusetts, and Tilson of Connecticut, and others representing districts far from agriculture, was too strong to be overcome. However, the game is not played out as yet, and the effort will be shifted from the House to the Senate which will not get the bill until after New Year's, and a strong effort is to be made to secure a butter amendment before the bill leaves the Senate. Persons interested in this can help by writing or wiring their senators asking for a tariff on butter, and sending copies of the letters and telegrams direct to Senator Porter J. McCumber, ranking member of the Senate Finance Committee.

⚜

The argument for this tariff is a very plain one. Butter has withstood the impact of big imports better than most commodities, but this is due to the strong organization of the dairy industry in part, and to the heavy demand for the rest, and is not an argument against a semi-prohibitive tariff at this time. The imports have been the largest ever experienced, over four hundred per cent greater than in the largest previous record. The imports for ten months of 1920 amount to nearly 31,000,000 pounds, as against seven and a half million pounds last year. The butter industry can not stand this impact indefinitely, and all reports indicate that larger imports are to be expected rather than smaller, if tariff relief is not given. The falling off in export business in condensed milk has created a demand for additional domestic butter markets which makes this protection against foreign imports doubly necessary at this time.

⚜

The National Grange, the National Board of Farm Organizations, and the American Farm Bureau Federation have agreed to support any reasonable plans which can be put through to put the butter tariff in the emergency bill. The National Dairy Council, the National Dairy Union, and the Creamery Butter Manufacturers' Association have been represented in the preliminary work.

⚜

Interest in dairy circles attaches to the plans of the Near East Relief and its big money campaign, and bigger program of relief work in Armenia. The proper financing of this work carries with it a potential market for a large amount of dairy products, especially condensed milk, now badly needed in the Near East. This is a commercial point of view on a great philanthropic movement, but is perfectly justifiable, for nothing is more needed in the work of the Near East Relief, according to statements made here by authorized representatives, than American milk products. The success of the Christmas drive is a matter of national concern in many ways.

⚜

Hearings were begun last Monday on the requests of the Department of Agriculture for appropriations for the year 1921-22. The sub-committee of the appropriations committee which will handle this bill consists of Hon. Sidney Anderson of Minnesota, chairman, Magee of New York, Byrnes of South Carolina, Wasson of New Hampshire, and Hawley of Oregon.

Roy Potts, dairy specialist in the Bureau of Markets, is recently home from a three-day stay with the Wisconsin cheesemakers in conference with the State Department of Agriculture working on the tentative cheese grading plans of the state. He reports a successful start in this difficult task, and that it will be reported later to the interested organizations for suggestions and criticisms, before being put into effect as perfected some time next year.

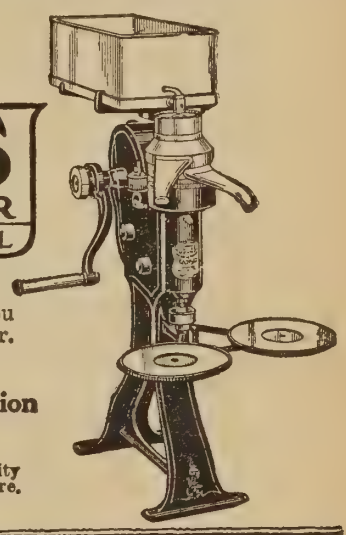
⚜

Consular reports recently made public show that the trade of the Argentine in butter with the United States is second only to its exports to England. The figures for the first six months of 1920 show the imports into the United States 44,800 cases as compared with 195,100 cases sent to England. No Argentine butter came to the United States in the same period in either 1919 or 1918.

⚜

Two new reports have been printed here recently that the long threatened suit to compel Dr. Fowler, district health officer, to accept New York State milk for sale here, will soon be started. In the meantime the announcement is made officially that there will be a four cents per gallon reduction in wholesale prices of milk from the Maryland-Virginia Association, effective Jan. 1. This reduction, it is stated, is necessary because of price reductions in Baltimore and Philadelphia.

So Easy to Clean



Ask the women

—Ask them what special features they consider first when choosing a cream separator. Nine out of ten will say "easy cleaning."

Just so. They know what it means to scrub and clean and assemble—twice a day. The United States Cream Separator has made the clean-up a matter of moments by giving you the first perfected bowl with INTERCHANGEABLE discs. Having no set order of disc arrangement to bother with, washing and rinsing is made quick and easy.

AND—the precise fit and smooth action that makes possible the interchangeable discs is also the secret of United States easy running.

UNITED STATES CREAM SEPARATOR
WITH PERFECTED DISC BOWL

You'll thank yourself twice a day if you choose a United States Separator. Write for catalog.

Feed Market Still Inactive

[Report by U. S. Bureau of Markets.]

There was very little demand for feed during the week ending December 11. Wheat feeds were quoted from $2 to $5 lower at some markets than a week ago. Quotations on bran were $26 at Minneapolis, $30 at Chicago, $28 at St. Louis, and $36 to $37 in eastern markets. Middlings were quoted at an average of $3 under these prices.

Sales of 43% cottonseed meal were made as low as $37 in Chicago and the statement that Texas mills were holding back large supplies tended to lower prices. Quotations on 41% meal were $32 in Memphis, $35 in Omaha and Kansas City, $38 in Minneapolis, $40 in Chicago, and $42 in Boston.

Buffalo and Minneapolis mills report a slight improvement in the demand for linseed meal at the recently reduced price of $41 f. o. b. mill. Quotations range from this to $45 in eastern markets. Gluten feed is quoted at from $48 to $52, hominy at $32 to $44, and beet pulp at $40 to $49.

Timothy is down to last year levels, No. 1 being quoted at $23 in Minneapolis to as high as $40 in New York. Clover hay and mixed hay is quoted $2 to $4 under these. Alfalfa is $27 in Minneapolis, $24 in Kansas City, $30 in Chicago, and $23.50 in San Francisco.

A woodlot is just as deserving of care and good treatment as is the garden, the orchard, or the pet horse,

Have You A Little Spare Time?

Have you a car—or a horse and buggy?

HOARD'S DAIRYMAN would like to offer you a proposition to look after our subscription interests in your community during your spare time.

It would be light, pleasant work among your old neighbors; and we can make it really profitable, too.

Write and tell us about the territory around you and how much you could take care of, and we'll make you a proposition.

Hoard's Dairyman, Fort Atkinson, Wis.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

It's all in the package

EVERYTHING else equal, people buy what looks best to them. People have been educated up to the parchment wrapper idea. It looks clean—and it *is*. It looks as though it keeps butter better, fresher, sweeter, more wholesome—and it *does*.

Where people have the choice they *buy* the better wrapped butter naturally, where they'd have to *be sold* the same butter, unattractively wrapped.

Buy Paterson Vegetable Parchment Wrappers in lots of 5000 or more, and we'll print advertisements on them displaying your brand and trade mark to the very best advantage and guaranteed not to stain the butter.

And then watch your butter sales grow.

PATERSON PARCHMENT PAPER CO.
PASSAIC, N. J.

Paterson vegetable parchment wrappers

Empire Oil-Burning Tank Heater

Greatest improvement ever made in tank heaters. Fits any tank. Burns from 14 to 16 hours on one gallon of kerosene. Any child can operate it with safety; no sparks, ashes or smoke. The heating chamber is entirely under water; no heat wasted. Guaranteed. Saves feed—pays for itself repeatedly.

Empire Non-FreezableHogWaterer

Made of heavy galvanized iron — large capacity (70 gal.); drinking trough on outside where hogs can reach it; oil burner directly under trough—guaranteed not to freeze. Keeps water warm at a small cost. An abundance of fresh, clean water at right temperature. Keeps hogs healthy—fatten faster on the same feed.

FARMER AGENTS

Special offer to farmers willing to show our Heater and Waterer to prospective buyers. Write at once for price and special offer. Buy direct from factory.

PAT. 7-2-07
ANTI-COW-KICKER

Save your temper, your cows, your milk. Does not excite the cow, nor disturb the flow of milk. Indispensible for breaking heifers, cows with sore teats, or vicious kickers. Cannot wear out. Put on or off in 15 seconds. Guaranteed to be an absolutely perfect anti-kicker, or put on loosely as hobble for cow, horse or mule. Price $1.15 Postage extra. Weight 2 lbs. Send for it **today**, when you need it you won't have time.

DAIRY EQUIPMENT CO.,
Dept. H. Topeka, Kansas.

LADD'S ALUMINUM MILK STOOL

Light, Comfortable and Durable. Easy to Clean and Sterilize. Demountable Legs.

Ladd's Aluminum Milk Stool will last a life time if properly used and will relieve the milker of the back-breaking position of milking.

Packed in individual cartons.

Price, postpaid, anywhere in the United States, each, plain, $3.25, polished, $3.75.

Association Notes

Oldham County, Kentucky:—Three unprofitable cows have been sold. All the cream separators in the association were tested during November. Most of them did good work, the skimmilk testing from .03% to .05%. Four per cent market milk sold for $3.49 per cwt. The creamery paid 60—64c per lb. for fat. Milk retails for 14c per quart, butter for 70c per lb., and cheese for 36c per lb. Feed prices are as follows: Corn, 65—75c per bushel; oats, 70—75c; bran, $42—$54 per ton; cottonseed meal, $46—$50; oil meal, $67; hominy, $45.

Pioneer, Minnesota:—The creamery paid 70c per lb. for fat during November. Market milk testing 5% sold for $4.75 per cwt. Milk retails for 14c per quart and butter for 70c per lb. Local feed prices are: Silage, $4—$5 per ton; hay, $10—$14; beets, $6—$8; corn, $20; oats, $20; bran, $34—$40; oil meal, $54—$70; molasses, $65.

Monona—Farmersburg, Iowa:—One registered bull replaced a grade Shorthorn, one registered heifer was bought for foundation; fifteen cows were sold, and eight cows purchased during the month of November. The average production for the association was 606 lbs. milk, 25.86 lbs. fat. Two herds averaged over 40 lbs. fat, six others over 30 lbs. fat, and six herds were below 20 lbs. Failure to heat water held the average down. The two 40-lb. herds were the only ones to use the tank heaters on testing days. The association received 33 tons of 43% cottonseed meal for $53 per ton. Dairymen received 70c per lb. for fat at the creamery. Feed prices are: Silage, $4 per ton; alfalfa hay, $36; clover and mixed hay, $20; corn stover, $5; oats, $30; corn and cob meal, $30; bran, $40; cottonseed meal, $70; oil meal, $80.

McGregor, Iowa:—The herd of John Geroghty has proven the value of feeding. One of his cows, Ret, made a net profit of $74.73 in 1919 and a profit of $164.62 in 1920 by feeding her a balanced and more profitable ration. This year his herd is going to do still better because it is receiving a well balanced ration, better than the one of 1920. During November the creamery paid 70c per lb. for fat. Milk retails for 12c per quart and butter for 58c per lb. Cottonseed meal is sold for $63 per ton; linseed meal, $72; silage, $4; timothy hay, $15; alfalfa, $30; oats, 42c per bushel; barley, 70c; corn, 60c.

First Kane County, Illinois:—A recent campaign for membership proved very satisfactory, as the number of cows for December will reach the 800-lb. mark. All members are interested in better feeding and are feeding balanced rations carefully and efficiently. A majority of the members own shares in or buy grains through a co-operative elevator. November's average production surpassed that of October. Market milk testing 3.5% sold for $3.05. Feed prices are: Bran, $38 per ton; shorts, $40; oil meal, $65; 36% cottonseed meal, $60; corn meal, $40; oats, $38; 18% sugar feed, $44; alfalfa, $30; clover, mixed, $25; timothy, $20; straw, $8; silage, $10.

Jo Davies County No. 2, Illinois:—This association started its work in April, 1920. The members are doing very well in the way of culling out the unprofitable cows and becoming interested in pure-bred cattle. They are doing away with their cow pens and are equipping their barns with stanchions and silos. During the eight months, four pure-bred Holstein-Friesian bulls, one pure-bred Guernsey bull, and eight pure-bred Holstein-Friesian females were purchased. Feed prices for November were: Silage, $8 per ton; bran, $2 per cwt.; mixed hay, $1.25 per cwt.; corn, $1; oats, 96c; oil meal, $3.50.

Skagit County, Washington:—On October 1st this association was organized and started testing with 31 members and 620 cows. Already several cows have been disposed of. The low price of milk, $2 per cwt., and the high price of feed keeps down the 40-lb. list. Two concrete silos are in use and another has just been completed. A new modern dairy barn is also nearing completion. All of the herds except one are headed by pure-bred sires and quite a number of the herds have pure-bred cows. Some official work has been done and one member intends to start again next month.

Monticello, Wisconsin:—The price of milk has dropped. Condenseries started skimming and paid from 45c to 55c per lb. for fat. Cheese factories paid from $1.50 to $2 per cwt. for milk. October feed prices are: Silage, $8; mixed hay, $30; bran, $36; oil meal, $66—$70; oats, 62c per bushel; barley, $90c.

Elkhorn, Wisconsin:—This is the first month of a new testing year. The association is starting out 100 per cent free from the scrub bull. About 80 tons of bran have been ordered at $35 per ton. Two members have put in milking machines and one has installed an electric lighting plant. Several are finding cows in their herds

which must be sent to the butcher. Members who have never been in association work before are becoming quite interested. In October, the condensery paid 75c per lb. for fat, and in addition 25c per cwt. for milk. Milk retails for 13—15c per quart, butter for 62c per lb., and cheese for 48c per lb. Local prices for feed are: Bran, $33 per ton; oil meal, $55; brewers grains, $55; ground oats, $30; ground corn, $38—$40; silage, $6.50; mixed hay, $26; alfalfa, $28; cottonseed meal, $58; Unicorn, $68.

Amherst—Nelsonville, Wisconsin:—Members are feeding good rations. During November, three cows were sent to the butcher. Two registered bulls and four cows were sold for dairy purposes and one registered bull and two cows were purchased. During the past year five members tested their herds for tuberculosis. Three members installed steel equipment with drinking cups and one installed a milking machine this month. The creamery paid 70c per lb. for fat. Milk retails for 12c per quart and butter for 60c per lb. Unicorn is rated at $62 per ton; bran, $38; oil meal, $62.

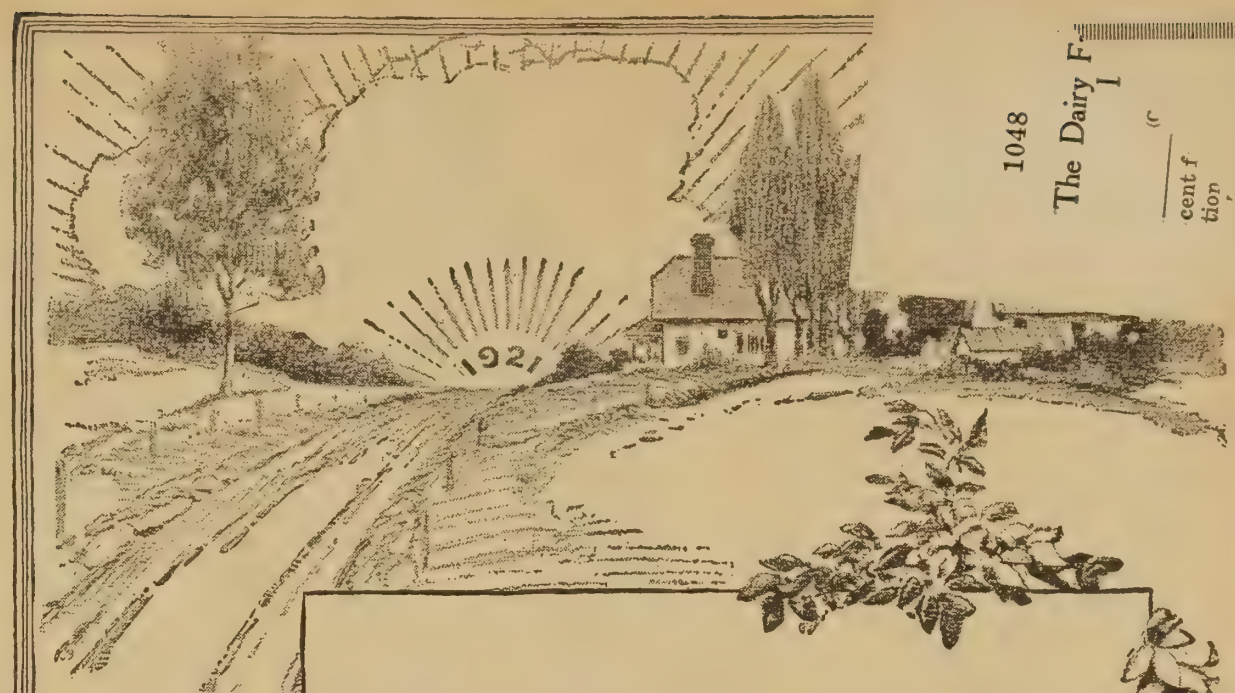
Shawano, Wisconsin:—This association finished its year November 30th. During the year 424 cows were tested, 310 finishing the year. Of these, 90 cows gave over 300 lbs. of fat, 28 of them qualifying for Register of Production. For the twenty-five herds the association average is 305.2 lbs. of butterfat. The high cow is a registered Holstein owned by A. H. Klebesadel; she produced 15,325.6 lbs. of milk, 571.1 lbs. fat. Her product was valued at $449.49, and with a total feed cost of $122.64 she gave her owner a profit above cost of feed of $326.85. The members having the three highest herd averages for fat were: A. H. Klebesadel, 356.8 lbs.; O. J. Berglin, 340.3 lbs.; and John Zingler, 313.1 lbs.

Racine and Kenosha, Wisconsin:—Two members, Clinton Skewer and Harvey Nelson, have bought a pure-bred bull ten months old for $6,200. This bull is a son of Carnation King Sylva. The farmers are not satisfied with the price they are getting for milk. Many bought high priced feed two months ago and cannot make a profit. During November, six cows were sold for beef. One member installed drinking cups. Three per cent market milk sold for $3.05 per cwt. and 4c per point above. Feed prices are: Bran, $38 per ton; ground oats, $37; ground corn, $36; ground barley, $38; oil meal, $61; cottonseed meal, $60; Unicorn, $68; clover, mixed, $28; alfalfa, $30; silage, $8; corn stover, $14.

Jo Davies County No. 1, Illinois:—Cows are mostly going on the root-hog or die-plan and the dairymen have their minds bent on cutting down expenses, which they certainly are doing in regard to getting their milk to the market or factory. Market milk testing 3.6% sold for $2.40 per cwt. in November. The creamery paid 64c per lb. for fat. Milk retails for 10c per quart.

Madison County No. 1, Illinois:—The milk business is still dull on account of the strike. In November 12 cows were sold. Two members installed stanchions and watercups. For 3.5% market milk, $3.10 per cwt. was paid, and 4c per point above. Creameries paid 56c per lb. for fat. Milk retails for 14c per quart and butter for 65c per lb. Feed prices are: Alfalfa, $30 per ton; clover, $24; cow-pea hay, $24; silage, $8; cottonseed meal, $3.25 per cwt.; peanut meal, $3.25; oil meal, $3.25; hominy, $2.35; crushed corn, $2.40; crushed oats, $2.40; bran, $1.90.

Kane County No. 2, Illinois:—There are some splendid cows in this association, most of the herds being good grade or pure-bred Holsteins, with one pure-bred Ayrshire herd. Most of the members buy feeds co-operatively. Members are all interested in everything that improves dairying. Calves are now being located for the Third Pure-bred Holstein Calf Club.



McCracken County, Kentucky:—Many of the dairymen in the association are having corn ground and are feeding a ration of 4 parts corn, 2 parts bran, and 1 part cottonseed meal. The owners of silos have opened them and are feeding regularly. A carload of bran and one of shorts have been bought co-operatively during November. Two unprofitable cows have been sold and three others have been turned dry and are being fed cheap corn until price goes up. Market milk testing 3.6% sold for $4.50 per cwt. and 6c per point above. The creamery paid 59c per lb. for fat. Milk retails for 18c per quart and butter for 65c per lb. Feed prices are: Cottonseed meal, $44—$50 per ton; bran, $38; shorts, $44; crushed corn, $20; sorghum and pea hay, $20; pea hay, $25; cottonseed hulls, $12; silage, $6—$8.

Canton, Pennsylvania:—Seven unprofitable cows were sold during November. Three per cent market milk sold for $3.56 per cwt. and 4c per point above this test. The creamery paid 67c per lb. for fat. Milk retails for 14c per quart and butter for 65c per lb. Local feed prices are: Cottonseed meal, $60 per ton; oil meal, $65; buckwheat middlings, $60; gluten feed, $58; Unicorn Dairy Feed, $72; Curtiss Dairy Feed, $70; wheat bran, $48; cow meal, $50; hominy feed, $50.

North Branch, Pennsylvania:—Balanced rations comprised largely of home grown feeds supplemented with protein feeds and fed according to production has been the slogan for the last two months and results are beginning to show. It will be only a matter of time until nearly every member will be mixing his own ration. Encouragement is also given in the feeding of dry cows and calves. Three per cent market milk sold for $3.85 per cwt. in November and 4c per point above this test. Milk retails for 13c per quart, butter for 72½c per lb., and cheese for 30c per lb. Mixed hay sold for $20 per ton; corn and cob meal, $26; ground oats, $34; wheat bran, $50; cottonseed meal, 36%, $70; linseed meal, $70; corn silage, $8 root crops, $8.

Juniata County, Pennsylvania:—The association bought a carload of bran recently at a saving of $9 per

Over Another Threshold

SOON you will put the calendars of a new year up on your walls. You have weathered the labors of the past four seasons—with what benefits and damages you recall full well. Now the cycle of a new year looms ahead, and we must prepare to gather the fruits of 1921.

It is a time when conservative manufacturing enterprises and business houses are reviewing the past, taking stock of resources, and building future campaigns. Leaks are stopped, needs are reckoned with, and plans are made with extreme care.

Winter is the best time in most sections for complete farm inventory, for overhauling machines and making repairs, for accurate reckoning of profit and loss, for planning crop changes, for discarding old habits and considering new methods.

Every farmer knows this. It is good to see that there is more and more definite planning of full year's work at the close of every December, on the farms of America. It is so easy a matter to slide through the comparative resting period of Winter, and then Spring with its hundred duties bursts forth and finds many important matters and details unattended to.

We are glad to note this trend toward business-farming because we hope to be allied with Agriculture many more years and because our interests are so closely mingled with the interests of the farming world. So then, while we are setting our own house in order for 1921, we pause to publish the hope that you, the reader, may set forth into a new year of farming enterprise with all plans laid for a most profitable twelve-month.

INTERNATIONAL HARVESTER COMPANY

Farmer and the Farm Loan Act

(Continued from page 1041)

for a month or so on a small portion of what he borrows.

The whole point is this: If the farmer will learn to use the farm loan system and come to realize that the banks of that system are created for his especial needs and that they are organized to take care of his long-term loans in such a manner that he is to be comfortably financed, he can have better success in financing his short-time needs, whether he uses a part of the money he borrows as working capital, or uses all of it to carry his land indebtedness and applies to the local bank for capital for temporary use.

If the dairy farmers will make large use of the federal farm loan system, they will discover many ways in which the joint stock land banks and federal land banks can be of service to the dairy industry.

Thinking Through

W. J. HAGAR, NEW YORK

A winning wager could be made that ninety-five out of a hundred thoughts are sterile. We neglect thinking through. We get an idea, turn it over in our minds, perhaps express it to some neighbor, wonder why someone does not drive it to an issue and then discard it with a "what's the use," or some stronger statement of similar sense.

We farmers are noted for this kind of thinking. We really do get some good ideas, but what do we do with them after we get them? We get some few of them across through our farm bureaus; that is, if our leaders can see their way clear to do their own share of the work plus about all the shares of a majority of men who never think through to say nothing about sticking through.

⚜

We almost thought through on the daylight tomfoolery, here in New York this year, but we had it put over on us again as usual. Possibilities are that we will ball our clocks all up again in 1921! ! ! Want to? We will if we do not THINK THROUGH this time.

⚜

Certain seasons, for our thinking is as seasonal as our cropping, stimulate certain lines of thought. For example, our farm products in New York State have to be moved, quite largely, when it is nearly impossible to move them. How we do think when we are bumping or slushing through our mud roads with car, truck, or team! Down goes one side! Out swerves the car! Out in the mud to put on the chains!! Under has to go the jack to get a wheel of the truck loaded with three or more tons of produce out of a hole! Crack! goes one of the bridges made strong enough to bear a cow or perhaps a ton of feed on a wagon! "Why don't they fix this road." "Why don't they fix this bridge!" "A h— of a town superintendent we have!" "Some civilized place this is!" This is as far as we think. And we keep on paying high tolls for this type of road ! ! ! We do not think through.

⚜

Country life betterment is said to have received its initial stimulus from George Washington. Too many are apparently waiting for him to complete the job.

⚜

Oh yes! Milk is down a cent a quart. Went down in Amsterdam, New York, just like it did, probably, almost everywhere else. Went down a cent or more to the producer. Went down a cent or less to the consumer. Went down not a cent or part of a cent to the distributor. He is always working on just a cost basis. He can not have it changed. He must be guaranteed the same income, or more. It may go up with him but he knows no downward trend. He THINKS THROUGH.

Clothes are imported under tariff protection. Wool comes in free. American wool growers will be giving it away ere long to get rid of it. Butter, beans, beef, hay, wheat, corn, oats, rice, grow costless here. A local hide is worth a few cents a pound while a pair of shoes (manufactured hide) costs nearly as much as the live animal sold for! We have not thought through on this tariff matter yet.

⚜

Our social, economic, and political development is like unto a boil; the bad stuff has got to work out from the inside. Pressure may be applied to the exterior but purification comes only with the removal of the interior rottenness.

⚜

We have some co-operative associations started. Some are for selling our produce and some are for buying our supplies. Some are for improving our stock and some are for improving ourselves. Other interests, so called, can not "do us" fast enough to satisfy us so we are trying to "do" ourselves in a good many cases. If we are members of a co-operative association some of us think ourselves smart when we "do" it. Good! Keep it up. We've forgotten what it was like before. We want to experience old conditions again! We very largely make our own conditions. We foster factors of our own economic destruction by baiting along our destroyers. The farm bureau is experiencing this test in some places. The Dairymen's League is undergoing the same.

⚜

Nearly every farmer made organization or attempt at economic betterment is tried in the fires of personal selfishness, petty jealousy, and common contempt. We do not think through.

⚜

Is it not time for us to think through some of these problems? Economic pressure justifies our endeavor. Political prestige and opportunity demands and affords it. Seasonal advantages induce and nurture it. To our mind our big job and our opportunity is to THINK THROUGH and do it thoroughly.

Price of Alfalfa and Dairy Cows

HOARD'S DAIRYMAN:—The peculiar situation as to the price of alfalfa hay in Idaho commented on in your recent issue seems to deserve a little explanation. Most western states have established a quarantine against alfalfa from Idaho and Utah on account of the prevalence of the weevil in these sections. The Spokane market is thus not open to our $9 hay although even if it were the difference in price would not be so remarkable as might appear. The $9 price means in the stack. Baling and hauling will cost from $5 to $8 depending on distance from the railroad after which must be added the cost of freight. Spokane is about as far from most Idaho hay shipping points as Pittsburg is from Chicago and by rail almost as far as from Chicago to New York, so that even though Northern Idaho and Washington adjoin that market is difficult of access.

It might be mentioned incidentally that the establishment of quarantines is not expected to prevent the spread of the weevil but it does seem to delay it enough to be worth while. Curiously enough eastern states, probably on account of lack of appreciation of the situation, do not seem inclined to establish quarantines. The prohibition as to hay does not apply to ground alfalfa and some attempt is being made to market it in this form. However, it does not seem probable that the demand for this product will relieve the surplus to any appreciable extent.

The present status of the Idaho alfalfa market is not essentially due to lack of dairy cows. In normal times most of this hay is fed to range cattle and sheep which are grazed in the mountain in the summer and fed hay in the valleys in the winter. The disastrous condition of these industries, however, has prevented stockmen from buying the usual amounts so that combined with the effect of the quarantines a surplus has resulted. We have a considerable start in dairying and the industry will no doubt grow but it should not be inferred that the dairy cow is the solution to this problem. Most eastern people rather assume that the old time range has been broken up into farms. But the irrigated sections occupy but a small fraction of the total area and though there has been much optimism about "dry farming" it has been a demonstrated success in only occasional places of relatively small extent even where the topography permitted. Most of the country west of the 100th meridian is and no doubt will remain a range and forest country and as it is not practicable to graze large areas of scanty feed with dairy stock we must continue to market our range grass in the form of beef, mutton, and wool. Range stock must generally be fed in the winters and this furnishes a market for much produce of the irrigated valleys. Though this interferes with the progress of dairying it is sound public economy and we would not be justified in urging that range stock handled under such conditions be replaced by dairy stock.

A corrollary to this conclusion is that there probably always will be an American beef industry and those who predict that beef will eventually be only a by-product of dairying will probably be found in error.

Idaho. J. F. BRUINS.

Purdue Short Course

At Purdue University, LaFayette Ind., a short course in dairy manufacturing will be given in the eight weeks from January 17 to March 11, 1921. Buttermaking, in factory and on the farm; ice cream making; testing milk and its products; market milk and cheese; and dairy bacteriology are among the subjects included.

Uncle Ab says: Some folks may think they're getting a lot out of life by just piling up a big bank account, but some day they're likely to learn different.

It Pays to STUDY the Feeding Problem

Can you think of a more profitable way to spend these long winter evenings than to get right down and **study** the subject of feeds and feeding from the best book ever published on this subject?

We offer you an opportunity to get this absolutely authoritative book without spending a cent of your money. We will send it to you, postage paid, in return for a favor you can easily confer on us.

You Can Get This Book Without Spending A Penny

Feeds and Feeding

Henry and Morrison

Wherever the subject of feeds for and the feeding of domestic animals is discussed, you will find "Henrys" quoted as the last word. It is without question the most thorough and scientific collection of facts on feeds ever brought together. This 701-page book—the seventeenth edition—represents a lifetime of work and research on the part of W. A. Henry, formerly Dean of Agriculture at Wisconsin University. It contains, in boiled down form, all that men have ever learned on the subject. This vast store of knowledge is so carefully compiled and so well indexed that any man who can read can follow and understand it. We would like to put a copy of this book into the library of every HOARD'S DAIRYMAN reader. Price $3.85.

Here's the Offer:

WE WILL SEND a copy of this 701-page book, postage prepaid, to any reader who will send us a club of just five subscriptions. They may be either new or renewal and either one-year-for $1.00 or three-years-for-$2.00 each. YOUR OWN RENEWAL MAY BE INCLUDED IN THE CLUB.

USE THIS COUPON—TEAR OFF ALONG THIS LINE.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Jerry Greene, Yer Honor

"That's it, that's it," repeated Jerry half aloud as he sat in the dimly lighted corner of the kitchen, glancing through the one farm paper that found its weekly entrance into the Greene household. "That hits the nail right on the head, the place where it ought to be hit, and believe me I'm mightly sick of it all," as he dropped the paper at his side, and rested his head wearily on the back of the old kitchen rocker.

"Pat," called his mother to her husband, "come quick, Jerry has fainted away," and she rushed over to where Jerry was resting. "I heard him say something about being sick and then he sank back in his chair, just like he is now," she whispered.

"What's the matter?" Jerry inquired as the parental duet approached him, much to their surprise.

"Why, you surely gave me a scare, Jerry," answered his mother. "I heard you say something about being sick and then all of a sudden you sank back in your chair just as if you had fainted. Are you sick, Jerry?" she hurriedly asked to make sure that she had not made a mistake.

"Well, I guess it wouldn't be telling a lie if I claimed to be," he replied with a fatigued smile lighting his tired face. "I didn't mean that I had a headache, stomachache, or any other disagreeable ache, but I've got an ache that's worse than all of those combined, and I mean exactly what you heard me say when you thought I had fainted away," he added defiantly as he straightened himself in his chair and stared into the bewildered faces of his parents. "I'm sick and tired of it all and, unless there is a change, I'm going to be a minus quantity 'round this place. It's Jerry this and Jerry that, day after day and week after week, without ever any consideration that I'm a human being and only a fifteen-year-old boy at that. But as long as I have waited, thinking that a change would come, things only grow worse, and I'm nothing but a slave 'round here. I never get a chance to play with the other boys, never had a calf or a pig of my own, and no matter how much I begged to be allowed to belong to one of the clubs, the answer was always the same: 'No'. I'm not getting half the chance that Jimmy has had, and the Lord knows what a time he had. But he was a better fighter for himself than I am and so I have had to stand for some of the things that he should have shared. It's all wrong, by gum, and there's going to be a change."

"Who put this fool idea into your head?" demanded his father gruffly. "Sounds like some of Jimmy's nonsense! Let me see that letter you received from him yesterday. I'll have to teach that boy a lesson," he added as he sank into the nearest chair.

"You won't get that letter, dad," replied Jerry, "and, furthermore, Jimmy never mentioned or even hinted anything like this. I just made up my mind that this is all wrong and there is no good reason for it either. In fact, I have been thinking a good deal about my lot on this farm and I guess I could preach you and ma a regular sermon upon the subject if I had to, and maybe I'll have to in order to carry my point," he slyly added. "My mind's made up and you ought to know what that means with a Greene."

Having thus concluded, he turned to gaze upon the moonlit slopes of the fields, now fast losing their blankets of snow and what he was thinking about we will leave to the judgment of any farm boy of Jerry's age.

"Well, if you're not satisfied, young man," spoke his angered father, "you can clear out of here. You don't work any harder than I do and don't forget that you're not of age yet, either. And, besides, when Jim's through college, we have promised that you can go. What more do you want than that? You ought to be willing to work and hard, too."

"Guess I have been and you'd find out too if I quit," he answered. "I'm not complaining about the work, dad, but I do think that I should be given a little recognition along the lines of things that boys like. It would make work so much more enjoyable and you would probably get more out of my hide than you do now. Just because I'm not twenty-one yet has nothing to do with the matter in my opinion. This is a free country, yes, and a democratic country, too, and if I'm any judge the type of people we want are those who do their own thinking instead of following a fixed pattern worked out by some one else. If a boy can think a man's thoughts, then let him think them and if he would like to try his hand at some of the things he sees older people doing then he should be given that privilege, too. A young man ought to be taught to grow up and not just allowed to grow up like the weeds we have to fight every summer."

Then noting a droll grin spreading over his father's face, he added, "read this", as he handed him the paper he had been reading when he had announced that he was sick of it all. "This is what set me off, dad", as he directed his father's attention to the following poem. "It's a hummer and it expresses my sentiments exactly, and you'll know what I mean and why I am dissatisfied when you have read it through. I wish Bob Ramsay was here to talk to you and ma."

"Read it out loud, Pat," spoke his wife. "If it is such good evidence we ought to listen to it. It is possible there is something to what Jerry is complaining about. You know times are changed, Pat, from what they were when you and I were children, and Jerry has certainly been a good, faithful boy and I don't know what you would do without him now that our oldest is away at college." But all she received in return was a discontented frown from her husband, saying as he looked at Jerry, "you read it if it is so good; maybe you can bring out the meaning better than I can anyway."

"Guess I can do that and then some," he answered, taking the paper from his father's hand. "But before I begin, I do want to say that I don't think you mean to be this way, dad. You just got the habit and because I never said anything you thought everything was all right and that I was satisfied. Maybe I'm to blame for not having kicked harder long ago. Just you listen to this though and I think you will be convinced of my point." And so he read:

"Why did you leave the farm, my lad?
Why did you bolt and leave your dad?
Why did you beat it off to town
And turn your poor old father down?
Thinkers of platform, pulpit, press,
Are wallowing in deep distress;
They seek to know the hidden cause
Why farmer boys desert their pas.
Some say they long to get a taste
Of faster life and social waste,
And some will say the silly chumps
Mistake the suit cards for their trumps
In waging fresh and germless air
Against the smoky thoroughfare.
We're all agreed the farm's the place,
So free your mind and state your case."
"Well, stranger, since you've been so frank,
I'll roll aside my hazy bank,
The misty cloud of theories,
And tell you where the trouble lies;
I left my dad, his farm, his plow
Because my calf became his cow;
I left my dad—'twas wrong, of course—
Because my colt became his horse;
I left my dad to sow and reap
Because my lamb became his sheep;
I dropped my hoe and stuck my fork
Because my pig became his pork;
The garden truck that I made grow
Was his to sell, but mine to hoe;
It's not the smoke in the atmosphere
Nor the taste for life that brought me here;
Please tell the platform, pulpit, press,
No fear of toil or love of dress
Is driving off the farmer lads,
But just the methods of their dads."

"How did you like it?" he asked, looking from one to the other. "I can't see how farmers figure," he added. "What difference does it make to them in the course of a lifetime if their boys have a little interest in some of the stock? It doesn't mean anything to their success one way or the other, but what a lot it would mean to some of the boys and I happen to be one of them. Every boy likes to have something for his own keeping; it's just a natural kind of desire that is born with him and I can't see why that desire shouldn't be satisfied and there's no place like the farm to carry out that idea. I'm that very boy spoken of in that poem, dad. You let me call all the calves mine, but never yet have I received one cent of income when they are sold. All I have at this time is just a fond memory of some of those innocent little things greedily bunting the pails over as I tried to feed all of them at one time. No, sir, it isn't right not to teach a boy to grow up. Working all the time without being given a little interest in the things we are expected to do! And it may be the difference between a successful and an unsuccessful man finally. Boys ought to think men's thoughts and do men's things when they get to be as old as I am. All I ever asked was to be allowed to be a member of the club that the other boys belong to. But for some reason you got it into your head that Jimmy was spoiled by the club and so I have to suffer, when as a matter of fact it was the club that gave him the inspiration to go to college and now you'll have to admit that you and ma are so proud of him since he has made good down there and been elected captain of the football team that nothing's too good for him in your eyes."

"That's enough, son," broke in his father with trembling voice. "I remember about a year ago that I wrote Jimmy how different things would be from that time on. I think I made good, too, at least in a part of my promises. We have a new house and automobile and I think we all take life easier than we used too. But about you, my son, I guess you have the right to make this complaint. I haven't given very much attention to you but to get all the work out of you I could. I see it now and I am sure you are right about it all. A calf or two won't break me and if it will make you a lot happier to have one, you can pick any one of the four we are raising this year, and you can join the club too."

"But I'm too old to join the club now, dad, at least I feel that way and it isn't a calf I want either. I've taken a liking for pigs and I'd awfully like to have old Goldie and the litter of pigs she is going to have in a couple of weeks. You can reserve the right to buy one of the litter if you wish, but other than that I want the right to do with them as I see fit. Goldie is a good sow and a pure-bred and I've just got an idea that if I go at it right I can make some money and start a bank account of my own so that, by the time I'm twenty, I'll have something to show for my work on the farm."

"It's quite a little you've asked, Jerry, but since you never owned anything of your own, I guess I'll have to say you can have her. But I shall expect you to give a good account at the end of the year."

"He'll do that, father," interrupted his mother quite as elated as was Jerry. "Greenes never fail when once they set out to do a thing. This will please Jimmy, too, for he always said that Jerry wasn't getting a square deal."

True to Jerry's prediction, Goldie presented him with a litter of eight within the next two weeks, and Jerry was just as proud of them as was Goldie. He looked after their every need, watching them closely for the first two weeks, with the result that not one of them was lost.

When seeding time came, he plowed up the old worn hog pastures and seeded them down to a mixture of oats, peas, and rape. He repaired all of the fences in addition, doing this in the spare time he had left after the chores were finished. By the middle

GOLDIE

of June he had a splendid pasture, and in it were feeding eight healthy Durocs. Never had he been as proud as when a passerby stopped to inquire about the price he was holding for them.

"Mighty fine pasture you have there, boy," he remarked. "What did you seed down with?"

"A bushel and a half of oats and peas each and about four pounds of rape," he answered.

"Where did you get the idea?" asked the stranger.

"From the agricultural college. You see I have a brother down there and he told me that this mixture is used there and that it makes one of the finest hog pastures one can get. The hogs feed off the oats and peas first and then the rape is ready after that and so that makes a pasture for all summer. Looks pretty good, doesn't it?"

"What price have you got on them?" he asked. "I'd like to buy a pure-bred sow of that breed and yours look mighty good to me."

"They are not for sale yet," he answered proudly. "I'm going to keep the entire litter until fall and then I am going to advertise them for sale as breeding stock. I'll have plenty of feed this summer and I think I can afford to do that."

"What do you expect to get for them then?" he further inquired.

"Oh, anywhere from $50 to $100 apiece if I work my cards right. They are worth that, I think, the way breeding stock sells. Both the sire and the dam have splendid records and if I do a little advertising I believe I can dispose of all of them. Dad would never advertise and so of course all of his pigs have gone on to the market as pork, but these are mine and I am sure that I can make some money off of them if I work it right."

"Tell you what I'll do, sonny. I want one of those young sows and I'll give you $50 cash right now and I'll take her along in this empty barrel. That's a good price and you better consider before you turn it down. What do you say?"

"No," came the answer. "If you are willing to pay that now I'll get more than that this fall. If feed was scarce I'd do it, but I have plenty for the summer and so I shall hold them."

"Give me first chance this fall then," he insisted.

"Sure! First come, first served, will be my motto, and you have the advantage, too, for you have seen them."

"I'll probably be around then, but if I'm not I wish you would drop me a line when you are ready to sell."

"That I'll do; but what's your name and where do you live?" he inquired.

"Well, sir, my name is Logan Reed and I live in the town of Dexter. That's where I get all my mail," and he waved Jerry a hearty good bye as he gave his team the word to move on.

"Looks pretty good," said Jerry to himself. "Business starting in already and I'm not ready to sell. Maybe he'll be back this fall and ask for all of them," as he climbed over the fence to get a closer view of the pigs.

"Sure I can make you weigh 200 pounds apiece by November at the rate you are going," he said as he stroked the sleek back of the young boar nearest him. "Four hundred dollars is the least the eight of you should bring. Yes, I've got my eye on you," he said, as the largest of the litter sniffed friendly about his feet. "Dad will probably want you, and, believe me, if he does, he'll pay for you. One hundred dollars is on your scalp right now and as much more as you will bring. You're a beauty, and you know it, don't you.

The summer passed swiftly along. The pigs were fast growing into hogs under Jerry's good management. He began to think of running an advertisement in some of the leading farm journals.

"'Twon't do any good,' remarked his father. "It will only cost you a lot of money and it won't bring you any more buyers."

"How do you know, dad? You never did a bit of advertising to sell anything in all the years you have farmed. So how do you know so much? You are only taking a chance on guessing, but I'm not playing a guess game. If you have anything to sell, you've got to find buyers or else you can't do business. People don't even know this place, to say nothing about there being breeding stock for sale here. There's got to be a beginning to everything and this is where we make this farm known. It won't cost you anything, that you know. But, by the way, dad, I promised you that you could have your choice out of that litter. There is one boar there that I think is a whale. You ought to keep him."

"Yes, but for how much?"

"One hundred bucks takes him, dad. There never was anything like him on this place before. Look all through yours and you won't find one like him. He'll sell like hot cakes when people see him. Might hold him for a couple of hundred, but seeing that it's you, $100 will take him."

WATERLOO, WIS., CORN JUDGING TEAM—1920 STATE CHAMPIONS
From left to right: N. O. Eckley (coach), E. Beyer, H. Higgins, D. Skalitzky.

"Whoever heard of paying such a price for a hog six months old," scorned his father.

"You have, right here, dad, I'm telling you."

"Well, I don't want him at that price, and I guess you'll find that no one else does either."

"All right, dad, you are counted out of the prospective buyers. But don't you ever come back at me and say that I didn't give you a square deal," he laughed. "Next week at this time Goldie will be the only one left and I'll have between four and six hundred dollars in the bank to my credit."

This brought forth a hearty laugh from his father. "There never yet was a Greene who made money that fast, son, and I've farmed now for twenty-five years. You're building air castles."

"All right, wait and see for yourself, and next week you watch for my ad in the farm papers." That night Jerry spent a good hour's work upon framing up an ad for his stock. He was very proud of it as he reviewed its contents, saying to himself, "That'll fetch the buyers." In this he was correct, too, for by the end of the next week he received no less than half a dozen letters from men who were strangers to him stating that they would be over to look at his stock. And this is what happened.

The Mr. Reed already referred to was on the job by special appointment. "I'll give you $225 for the three sows," he said, "that is at the rate of $75 apiece."

"Better than I had really expected," Jerry answered, "but seeing that you set your own price, I'll hold you to it and you can have them for that."

"Don't let him have that boar, Jerry," called his father from the barn.

"He can have him unless you want him, dad. What do you say? Shall I save him for you? Not less than a hundred you know."

"Yes, I know, and I want him too; so hold him."

"Clever bit of work you got in there, son," commented Mr Reed. "But, by the old cracky, he is a bird, isn't he? Cheap at that price, I would say."

"Glad you think I'm not slipping anything over on dad," Jerry laughed.

"Well, that's $325 for four of them and I have four boars left. They ought to easy make up enough to total $500," and he chuckled to himself as he stepped up to his father and shook the $225 in his face, saying as he did so, "Come across, dad, with your $100 and then I'll have $325 for half of the litter."

"Do you mean to say that you asked Reed that much for those sows?" remarked the astonished father.

"Didn't ask him a cent for them. He made his own price and I took him up. He saw the quality in those pigs. See what you've missed, dad, all of these years by being so conservative. Besides you are paying a good price for that boar too, don't forget that."

And just at that point in the conversation, another wagon drove up carrying two hog crates. Jerry was on the job again in a hurry. "Only got four left and they are all boars," he apologized.

"Don't want any sows," remarked the buyer, "nor boars either unless they are very superior."

"The only kind I deal in," came the quick reply. "The big fellow is sold," he remarked, "but you can have your choice of any of the others."

"What are you holding them at?" he inquired as he carefully looked them over.

"Seventy-five dollars apiece," answered Jerry boldly. "They are worth it too, Their breeding is all that is described in the ad you read in the papers. I'll stand back of that."

"Little small for that price and this time of the year, son. The big one is worth that. He's got the type I like."

"Yes, and he brought $100, too," Jerry answered, "so I don't think that $75 is too much for the others. All out of the same litter."

"Give you $130 for two of them. What do you say?"

"Hate to do it, but seeing that they are possibly a little undersized, I'll take you up." The two were quickly captured, loaded and driven away. On his return to the barn, Jerry encountered Mr. Ramsey.

"Came over to buy one of your young boars, Jed," he smiled. "Have been watching them all summer and they are a mighty fine litter. Bob saw your ad in one of the papers and he wrote home and asked me to buy one for him You see he has to furnish one-half of the stock now that he is in business with me. What are you getting for them?"

"Just got $65 apiece for the two that he took," as he pointed to the wagon leaving the yard. "Dad paid me $100 for what he thought was the best one and the three sows brought $225. Seeing it's you, Mr. Ramsey, and we are good neighbors, I'll sell either or both of them to you for $50 apiece."

"The fact that we are good friends has nothing to do with it, my boy," advised Mr. Ramsey. "If they are worth that price, you ought to get it. Business is one thing and friendship is quite another. And the former should not be influenced by the latter," he added as the two climbed into the hog pasture.

"They are worth it, Jerry. I've bought a good many hogs in my day. I'll take both of them. Bob will want one at home and the other he'll place on the farm that he does not yet know is his."

That afternoon he came with the wagon and took the two, leaving only one which was to be his father's as soon as the money was paid over. "Didn't I tell you it could be done, dad?" Jerry joyfully exploded as his father paid him the one hundred that evening.

"Well, I didn't believe it," he sheepishly answered, "but I guess I'll have to admit now. I thought Jimmy was pretty smart, but he'll have to take his hat off to you, son, and, by the way, you had better bank that money to-morrow."

And as Jerry stepped up to the cashier's window the next day with his deposit slip, the cashier remarked, "Want this to go on your father's account?"

"Indeed not, can't you see my name at the top of that deposit slip? I'm Jerry Greene, yer Honor, and this money is all mine. Made it all on one litter of fine pigs and I have the old sow left for another start next spring."

Junior Letters

Hoard's Dairyman Juniors:—I am thirteen years old and in the 7th grade at school. I have one white and black calf which is nearly a full blood. I have four white rabbits but intend to sell them. My brother has a black and white calf which is also a good grade.

We have a 120-acre farm. Have a good team of horses, 5 and 6 years old, and I have also a pony and a dog. The dog's name is Buster. The pony's name is Flora and I have many a happy ride on her back. My calf's name is Bidy. We have 20 pigs now but intend to sell most of them. We have four milk cows, 1 yearling heifer, and two calves, one of which is mine.

I wish some of the juniors would write to me. My address is Box 100, R. F. D. No. 1, Marinette, Wis. Shelby Keill.

Hoard's Dairyman Juniors:—I am 10 years old and I am in the 4th grade. I go to a Catholic parochial school.

I have two dogs, one's name is Rexe and the other Sheppy. My father has put up a stave silo and we had it filled. We also built 13 ft. on the barn this summer. We have five little pigs. They are growing fine and I have got the mother of them. She is growing fine, too. We have 100 acres of land. We got 128 bus. of oats and 47 bus. of barley.

Wisconsin. Edmond Brandt.

Hoard's Dairyman Juniors:—We have about eighteen pure-bred Holstein cows. We have twenty-two shoats and twenty-two little ones. We have thirteen horses. I have a Shetland pony. His name is Toby. I took him to the fair one year, but did not get any prize. My father rented the farm this year. I am twelve years old and in the 7th grade at school. We live right near a lake. I go swimming every day.

Wisconsin. Leslie Gilbert.

Buildings in fair condition, but land is high producer. Must be sold to settle Estate. Deal direct and save commissions. J. L. WHITE ESTATE, Cayuga County, Locke, N. Y. 24-3

Where dairy farming is profitable—There are localities in the South where, on account of the rapid development of industrial cities and towns, supplies of dairy products are short and prices are high. In these same localities long grazing seasons and winter cover crops cut down feeding costs and all conditions are exceptionally favorable for profitable dairy farming. Good improved farms can be bought at prices much lower than are asked for similar lands in other parts of the United States. Buy a Southern dairy farm now while prices are still low, make money and build up a valuable property. Forr full information write to J. C. WILLIAMS, Manager, Southern Railway Development Service, 1302 Pennsylvania Avenue, Washington, D. C. 14-spl.

160 acres. 2 miles, county seat. Dark clay loam, high state fertility, good 9-room house, 2 good barns, plenty out buildings, excellent 10-acre orchard, $100 per acre. Write us for farm bargains in southern Michigan. MICHIGAN FARMS AGENCY, Box 928, East Lansing, Michigan. 11*

Answer stating experience, with references and salary desired. Address WARWOOD FARM, Lisle, Illinois. 24-2

The Right Dairy Sire

HOARD'S DAIRYMAN:—The most important factor in the improving of our dairy herd is the use of the proper sire. We can improve the stock we have by better feeding, better general care, and by the keeping of records so as to eliminate unprofitable animals, but the only method to really improve the breeding is by the introduction of new and better blood through the pure-bred sire.

The old saying that "the sire is half the herd" is certainly true. If he is the proper sire and a good one, he is more than half the herd. If he is a poor sire, he is all the herd.

The first and most important thing in the selection of the right sire for our dairy herds is that he should be of dairy breeding. It is useless to try to build up a good dairy herd by using sires from beef producing strains. To use such a sire is to insure failure at the outset.

The dairy sire should be not only of dairy breeding but he should be pure-bred. The fact that a man has a grade herd would indicate that he recognizes the value of better blood in his stock. If a grade sire is better than a scrub, then certainly a pure-bred is better than a grade. There is so little difference in price between the very best grade that can be bought and a pure-bred that is better, that it is not worth while to waste time in using a grade.

Because an animal is a pure-bred and of dairy breeding does not necessarily mean that he is a good animal to head a dairy herd. We have many pure-bred bulls that are not improving the herds they head. Any bull that does not improve the herd is a scrub for that particular herd. The good dairy sire should be not only pure-bred but he should be "bred-for-production".

By "bred-for-production" we mean that he has in his ancestry a number of high producing dams. This quality can only be determined by knowing the pedigree; it is the basis for determining the productive qualities of a young dairy sire.

A good pedigree, besides giving the exact ancestry of the animal, should show four things:

1. The milk and butterfat records of the cows in the pedigree.

2. The records of any sons or daughters of animals which appear in the pedigree.

3. Any show ring records that the animals have made.

4. It may show any remarkable sales made by animals whose names appear in the pedigree. A good pedigree should show good milk and butterfat records by the immediate ancestry of the bull whose pedigree we have.

Occasionally we find good animals whose immediate dams may not have any advanced registry records. This does not necessarily mean that the animal has a poor pedigree and we should not condemn him on these grounds because in all probability the reason his dams have no advanced registry records is because their owners did not do advanced registry work. Neither the sire nor dam of the world's champion Guernsey cow has advanced registry records. Pedigree is not everything. Many an animal with an excellent pedigree is a very poor individual. We want not only a good pedigree but also a good individual.

The pure-bred dairy sire should be good size for his age. Size is an important consideration in the building up of a good dairy herd. The large cows of any breed are generally the better producers in the breed. The demand now is for dairy cattle that are good size and in buying a dairy bull size should be given consideration.

Just how good a bull or how good records that bull should have for any particular herd will depend on the quality of that herd. As a general rule, the bull should have better records than any cow in the herd. The value of this can be understood when we realize that the blood strain carried by the bull represents fifty per cent of the blood that will be carried by his offspring in that herd. The better the blood the greater the improvement we can expect from his use in the herd. We can not get too good a bull for our dairy herd.

The real test as to the value of a dairy sire in our herd depends on his power to improve the production of that herd. The only way we can tell whether he is improving the production of the herd is to keep him until his daughters have freshened and we know whether they are better or poorer than their dams. If they are better than their dams were at the same age, then we can safely say that this improvement is due to the sire. If, however, they are poorer, then we must conclude that our sire is not improving the herd and we should endeavor to get a better one.

Do not sell your dairy sire for beef just because you have used him in your herd two years. Many a good dairy sire that was making great improvement in the herd has been sent to the block because the owner did not know his value. Fort Hill Farm Chief, the sire of Sophie 19th of Hood Farm, the former world's champion Jersey cow, only had three tested daughters and was slaughtered before it was known that his daughters were such remarkable producers.

In getting a new sire to head your herd one thing should always be kept in mind and that is that he should be better than the last one you had. If your last sire has improved your herd and you expect to continue that improvement, it is absolutely essential that the new sire brought in should be better than his predecessors. In this way constant improvement in the building up of your dairy herd is assured.

Cost of Production

HOARD'S DAIRYMAN:—I read with great interest the article in a recent Dairyman, "Farmers Control the Price of their Products", especially the section on the "Cost Plus Idea Discarded". Particularly so, because my own position as printed in the issue of Feb. 13, 1920, called forth some unfavorable criticism by farmers. Indeed, some of my associates were rather skeptical at the time as to the soundness of the position and still more so as to whether the Dairyman or any other farm paper would print it.

It is encouraging, however, to know that a group of farmers who were really thinking about *facts* worked out the proposition for themselves "ten years ago" as the article says. It gives me cause to hope that my campaign for farm accounts will ultimately be successful. Farm accounts I consider *only a means to an end*, but the end is worth going after, and the means is worthy of the end. These California fellows demonstrate that farmers in possession of the facts know what to do to promote their best interests, and how to do it, too. "Accounts on every farm" means, if it means anything, putting farmers in possession of the facts they need so sorely in the management of their farm business and at the same time to make their organizations possible and their organized work effective. S. W. MENDUM.

Association Notes

(Continued from page 1047)

ton. It also purchased a mixed carload of cottonseed and oil meal at a considerable saving. The herds are practically all on well balanced winter rations now and production is good. The price of milk dropped on November 1st to $3.02 per cwt. for 4% milk, making an average of $3.46 from October 15th to November 15th. The creamery paid 70c per lb. for fat. Milk retails for 12c per quart and butter for 75c per lb. Feed prices are: Silage, $6 per ton; hay, $20; corn stover, $8; corn and cob meal, $38.20; ground oats, $35.20; bran, $41; cottonseed meal, $75.30; oil meal, $65; Union Grains, $71; International Dairy Feed, $73; Feerless, $70.

Wilson County, Tennessee:—Cows were very low in milk flow in November, due to change of season and insufficient amount of grain feed. Several members are planning to feed a balanced ration of corn, oats, bran, and cottonseed meal, Practically all of the members are beginning to feed silage. The highest herd was fed 2 parts bran and 1 part cottonseed meal to supplement a corn stalk field as pasture. Feed prices are: Silage, $5 per ton; Schumacher, $60; cottonseed meal, $50; Dairy Feed, $50; bran, $45; cottonseed hulls, $11; oats, 65c per bushel; corn, $1. The creamery paid 50c per lb. for fat during November.

Kent County Co-operative, Michigan:—Several members are trying to make better production records by feeding balanced rations, with a view of getting the greatest production per 100 feed units. November milk testing 3% sold for $3.60 per cwt. The condensery paid 60c per lb. for fat and the creamery paid 61—63—64c per lb. for fat. Milk retails for 17c per quart. Feed prices are: Bran, $40 per ton; ground oats, $40; Unicorn, $68; oil meal, $70; cottonseed meal, $56—$65; barley, $56; corn meal, $52; gluten feed, $56; silage, $8; clover hay, $22; timothy, $26; corn stover, $10.

Emmet County, Michigan:—For the year just ended, the 237 cows of this association averaged 5,450 lbs. milk containing 232.9 lbs. fat. The average test was 4.2 per cent; average cost of feed, $90.05; income over cost of feed, $59; return from $1 of feed, $1.65; cost of one pound of fat, 36c; cost of 100 pounds of milk, $1.65. The highest milk production record for the association was made by a grade Holstein owned by Charles Lempke with a record of 11,943 lbs. milk and 354.1 lbs. fat. The highest fat production record was that of a grade Guernsey owned by Paul Schnelle, 6,700 lbs. milk containing 445.6 lbs. fat. The best herd record for both milk and butterfat was made by the grade Holstein herd of Charles Lempke, ten in number, that produced an average of 9,538 lbs. milk and 317.1 lbs. fat. The second highest butterfat record was made by a herd of 12 grade Holsteins and Guernseys owned by Paul Schnelle. They averaged 6,700 lbs. milk and 315.1 lbs. fat. Among the 237 cows, 80 produced over 250 lbs. of fat, 32 produced over 300 lbs., 11 produced over 350 lbs., and 4 over 400 lbs.

Ayrshires Lead Ohio Association

The Penfield Cow Testing Association of Ohio is made up of twenty Holstein herds and one Ayrshire. In the last year's work the Ayrshire herd of B. G. Betts and Sons easily proved its superiority, leading in fat production by a considerable margin, the herd averaging 11,174 lbs. milk, 443 lbs. fat, and the nearest Holstein competitor 12,839 lbs. milk, 398 lbs. fat. The average of the entire association was 9,136 lbs. milk, 312.1 lbs. fat. Messrs. Betts' herd returned $3.15 for $1 expended for feed. The feed cost per cwt. milk was $1.21 and the feed cost per pound fat 31c. The averages for the entire association were as follows: Returns for $1 expended for feed, $2.14; feed cost per cwt. milk, $1.69; feed cost per pound fat, 49c.

Vermont. J. G. WATSON.

Survival of Fittest in New Hampshire

HOARD'S DAIRYMAN:—The law of the survival of the fittest as operative in a cow testing association—where the low producing animal is discarded and the profitable cow retained—has made a wide swath in New Hampshire. During the past 12 months 216 animals, representing membership in 7 cow testing associations, were consigned to the shambles for beef purposes and their stalls replenished by more prolific milk producers.

The cow testing associations of New Hampshire have justified their existence by results to the farmers and dairymen in dollars and cents. Nineteen herds, belonging to six associations, for the past two years have evidenced an increase of 763 lbs. of milk to the cow, and an increase of $49.30 in the income over the cost of feed. Six herds in an equal number of cow testing associations, in operation for three years, have shown an enhancement in the contribution to the pail of 866 lbs. to the cow, and an income over cost of feed of $98.31 more than the herds formerly averaged. The unprofitable dairy cows that are being marketed for beef no longer injure the dairy industry, unless their surviving progeny have been sired by inferior bulls.

"In general, cow testing association work in New Hampshire is on a sound basis," says the Dairy Division of the United States Department of Agriculture. "Association members are studying individual cow records, the ability of pure-bred bulls to increase production, wise feeding practices, and the proper training of young stock. The influence of these studies is affecting even dairymen who are not members of the associations."

Washington, D. C. S. R. WINTERS.

Holstein Breeders' Sale

The Holstein Breeders' Sale Co's. recent sale held at Fond du Lac, Wis., December 3—4 was but fairly successful. The buyers were fewer and the cattle were not of as good quality as at some of the earlier sales.

The entire 113 head sold for $22,370 with $725 the top figure. T. C. Wilsie paid this for Master Ormsby, a 29.48-lb. grandson of Sir Ormsby Johanna De Kol consigned by Baltz Hoesly.

Mack, Pohlman, and Laux did the selling with F. H. Everson in the box.

The following list includes those animals selling for $250 or more and buyers.

J. A. Warher, Wisconsin	
Oak Fobes Mutual	$350
S. E. Jones, Wisconsin	
Johanna Canary Polkadot	$280
Idyl Grace De Kol Boon	250
Johanna Fayne Posch	305
B. E. Sampson, Wisconsin	
Dame Lyons Wellington	$300
A. A. Backhaus, Wisconsin	
Mamie Felecia Homestead	$290
Lucy Fayne Korndyke De Kol	365

May 18—Jerseys. Monroe County Jersey Breeders' Consignment Sale at Tomah, Wis.

Waukesha County Winter Holstein Sale

Waukesha County Holstein breeders held a winter sale at Waukesha, Wis., Dec. 13, selling 70 animals for $20,390, just short of a $300 average. This figure does not apparently compare favorably with the average obtained at the annual fall sale held a month earlier but it does indicate a good sale if one considers the large number of young bulls included.

It was a yearling bull from the herd of Fred Wieffenbach that topped the sale going to Frank Boller, Wis., for $1,275. He is a grandson of King of the Pontiacs and of Piebe Champion as well as a show calf, having won first at the 1920 Wisconsin State Fair and fourth at the National as a senior calf.

Baird Bros. consigned the second highest priced animal, a yearling son of King Superba from a 856-lb. daughter of Bairdland Segis Sir Prize. He was purchased by J. C. Wilton for $1,000.

The following list includes all animals selling for $300 or more and buyers:

O. A. Lukken & Sons, Wisconsin	
Sir Bess Fobes Ormsby 2d	$375
C. G. Quinn & Son, Wisconsin	
Gerben Clothilde Lyons 2d	$515
F. J. Woefel, Wisconsin

How many cows in your dairy are in A-1 health?

PREVENTION of disease is the first chapter in the gospel of profitable dairying.

Not every cow in your dairy can make a conspicuous production record, but not one of them should be allowed to limp along as "poor milkers" when their yearly yield could be decidedly raised by keeping the organs of production in a top-notch health condition.

This health program does not mean an expensive veterinary service; in most cases an adequate home treatment is simple and easy. The most prevalent cow diseases, such as Retained Afterbirth, Abortion, Barrenness, Scouring, Bunches and Milk Fever, are directly due to a weakening of the digestive or genital organs. Proper treatment will make them function normally.

KOW-KARE is distinctly a cow medicine; it acts directly on these organs, with prompt and noticeable results. The KOW-KARE treatment is so simple and inexpensive, no wonder it is so widely used.

Feed dealers, general stores and druggists sell KOW-KARE; 70c and $1.40 packages. Let us send you our free book, "The Home Cow Doctor."

DAIRY ASSOCIATION CO., Lyndonville, Vt.

Manufacturers of KOW-KARE and BAG BALM

Her Milk Record Is 13,227 Pounds

LAST YEAR this splendid 5-year-old GUERNSEY, besides this notable mark in milk production, had a butterfat total of 653.4 lbs.

Such profitable producers are only found in the dairies where cow health is carefully guarded.

NOTE: The trade-mark name has been changed from KOW-KURE to KOW-KARE—a name more expressive of both the PREVENTIVE and CURATIVE qualities of the remedy. There is not the slightest change in formula or manufacture.

Are Rural Women Dissatisfied?

HOARD'S DAIRYMAN:—In the August sixth issue of Hoard's Dairyman there appeared quite an interesting article entitled "The Waste of Woman Power". While I have no desire to dispute the writer's statement, I think it sounded a bit pessimistic. Judging from the many glowing articles I have read about the big, breezy West and the great hustling North, I was shocked to learn so many farm homes are minus so many necessary conveniences. Here in Virginia, I have travelled over the greater part of it, I am thankful to say our farm homes are improving wonderfully. In this section it would be rare to find one minus a bath room and running water in the kitchen. True, there are different classes of farmers and farmers' wives, just as in the city we have the poor, those fairly well off, and the very wealthy.

Some rural women are ambitious to have modern homes and they get in harness with their husbands until their dreams are realized; others possess the knack of getting along without many conveniences and evidently they have cultivated the spirit of contentment; while a great many farm women are eager to make money for themselves and add some comforts gradually. As a rule, farm women receive a great deal of unnecessary sympathy, usually from people living in towns and cities. They imagine we are isolated, but I think the majority of rural women are the most contented people we can come in contact with. Usually they live on farms from choice, as in these days many fields are open to men and women in cities if they choose to sell their farms and migrate there. Usually we have so many interests on the farm that they keep the mind and the hands occupied.

Help is more difficult to obtain than formerly, but we must remember that the farmer has more modern machinery to till his crops with; hence there are fewer hired men to feed than formerly and this is a great relief to the housewife. Farm families are decreasing in size and when we hear of a large family living on a farm, they soon cultivate the help-one-another habit, hence many hands make light work. Divorces are rare in rural districts in the South, but take a peep at the big cities where the wives have practically every convenience imaginable. They have more time for the movies and the resorts and a restless habit is soon formed. They are not nearly as happy as the rural woman, for the latter's home life is full of interests. The yard, the trees, the flowers, the garden, and the orchards have "their history" or perhaps the home is a quaint, old fashioned one and it has been in the family for generations, or probably it is one father and mother had been planning to build for years. Even the various fields on the farm are interesting to the family, probably one is where father grew his prize wheat and the other has been tile drained lately, hence the growing crop of corn is watched with interest. Then there are the horses and cattle, these not only help to fill the grain bins but they depend on the family for a living.

Farm life has many attractions for those who have been reared in the country. There is the very necessary automobile that takes us into the village and into town to see a good "movie" after our day's work has been finished. The automobile has done more to make our farm women contented than many home conveniences. Then there is the travelling library and a musical instrument of some description in practically every farm home. While we have to work, probably more arduously than ever, we have our compensations also. Many of us visit the village store and the post office daily. Then there are picnics, festivals, farmers' institutes, and fairs galore; yet the average farm woman does not take a yearly vacation! Why, many of us have a daily outing and a trip off to some large city every spring and fall to study the styles and to hunt for bargains, etc. When permanent macadam roads are built in every rural district our farm folks will be a happy and a prosperous class of people.

Virginia. MARGARET T. MERTON.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Oil Meal to Cows Near Parturition

Joseph C. Sibley, veteran breeder of Jerseys in Pennsylvania, contributes the following suggestion in a recent issue of the Jersey Bulletin, from his store of practical information on cattle management.

"A few years ago a Pennsylvania farmer, Mr. L. A. Tucker, visited my farm. A cow in our herd had failed to clean. Our veterinarian had frequently been called upon to remove the placenta from cows in our herd, a somewhat disagreeable and trying operation for both man and animal. Mr. Tucker had never had the advantage of a technical education, but had been graduated from the "University of Hard Knocks". He inquired of me if we were frequently troubled in this manner. I stated that we were troubled with such frequency as to make it extremely annoying. He said he never had any of it in his herd and the reason was that some weeks before the cow was due to calve he commenced feeding a pound of linseed meal daily, until at the time of calving (the quantity of meal having been gradually increased for five or six weeks) the cow was eating three or four pounds of linseed meal daily. This struck me favorably because it was not difficult to recognize that the linseed meal was not being wasted, and at a later period we would get it again in stored-up butterfat, more valuable than the meal. Many years have come and gone, but never from that day to this has a cow of ours failed to have easy parturition or to deliver the afterbirth promptly."

Teat Troubles

What can be done for cowpox, leakers, hard milkers and wart-like scabs on the opening of teats?

Poular, Wis. L. J.

Cowpox has to run its course. Isolate any affected cow and milk her last. If necessary use a sterilized milking tube to draw off the milk. Boil the tube for 15 minutes each time before use. Keep the teats, udder, and stall perfectly clean and milk with clean hands. Filth complicates matters and causes obstinate sores, or induces ruinous garget (mammitis). Bathe inflammed udder and teats twice daily with a saturated solution of boric acid and apply balsam of Peru to sores when scabs come off. If any sore is obstinate apply strong iodin ointment daily. Coat ends of leaking teats with melted wax or paraffin after milking and if that does not suffice apply flexible collodion. Dilators should be used to increase caliber of teat openings and if that fails a teat bistoury should be used, by a veterinarian, to slit down through the obstruction or stricture in four different directions. Growths should be removed with a small scalpel, a special sharp-edged, inverted, cone-shaped instrument or with caustic.

The syringing advised only applied to the vagina. Douching of the womb requires special instruments and skill.

Abortion

We have about 12 cows, mostly grade Durham. Several of them seem to have rheumatism. Those that are so affected sometimes abort at about 7 months. I have a bunch of heifers from those cows. Should I keep them? Cows are never sick, just lame.

Sears, Mich. C. S. C.

It is quite possible that the cows in question are tuberculous and to determine that you should at once have the tuberculin test applied, if that has not been done. The disease often causes just such forms of lameness. The abortions, however, more probably are due to the contagious abortion disease. To determine if the infection is present your veterinarian might arrange to have a sample of blood from each cow tested for abortion at the state agricultural experiment station. That is the only reliable means of determining presence of the infection. If the cows are tuberculous they should be disposed of in accordance with state law. If that disease is not present a combination of chronic rheumatism and contagious abortion disease also would be good grounds for disposal of the animals to the butcher. Rheumatism seldom affects cattle that are not kept in a damp stable, such as a basement barn without good ventilation.

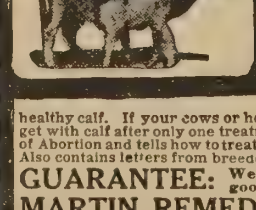
Treatment After Dehorning

Please tell me where I can get medicated pads for the heads of cattle after dehorning them, to stop the bleeding and keep out the cold air.

Walnut, Miss. J. N. Q.

We do not know of such pads, but they are unnecessary. Simply apply pine tar and oakum held in place with a bandage in ordinary cases. If bleeding in any case is severe bathe constantly with very hot water containing coal tar disinfectant and when the bleeding practically subsides apply the tar and oakum. In 24 hours remove the bandage and allow the oakum to come off without pulling.

Abortion



Is there any serum that is on the market now that is cure for abortion? If so, where can it be purchased? If there is and it is given the cow which lost her calf, how long before she should be bred in order for her to carry her next calf?

Ohio, Ill. C. A. B.

There are many different biologics on the market for use by veterinarians in the preventive treatment of contagious abortion disease, but it cannot be said that any one of them is a practical success. Neither does any one of them render a cow noninfective so that she may safely associate with clean cows or be bred by the herd bull. Thus far disinfection is the better means of dealing with the disease and methods for its application have often been published here. Apply to the veterinary department of the agricultural experiment station for a bulletin on the subject, or obtain one from the Department of Agriculture, Washington, D. C.

ABORTION IN CATTLE

CAN BE TREATED SUCCESSFULLY AND YOUR COWS MADE PROMPT. REGULAR BREEDERS BY

STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for **FREE BOOK.** It explains the causes and symptoms of Abortion and tells how to treat Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: **We will refund money in every case when STERILOID FAILS to make good. PRICE $1.00. Mailed Postpaid, in plain wrapper.**

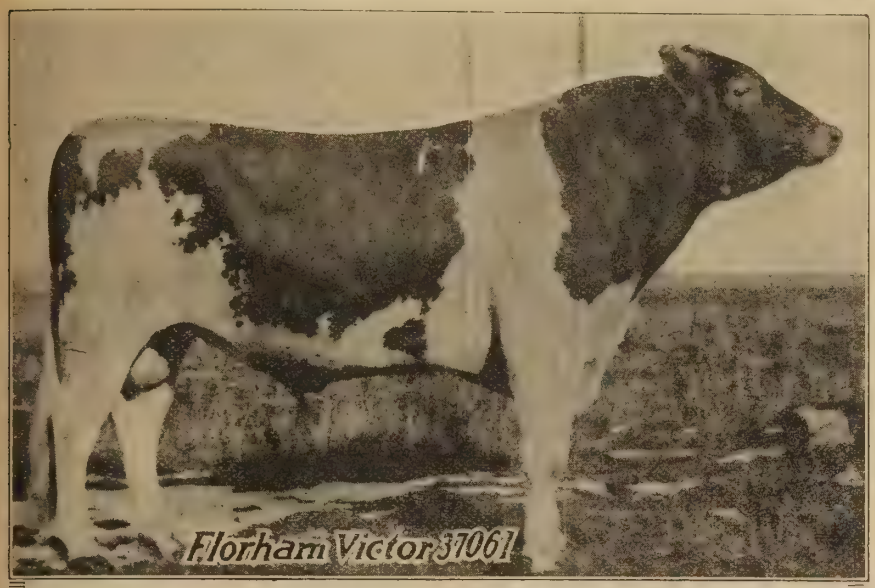
Box 30, Roslyn New Yo



Economy in Production ← **GUERNSEYS** → Quality of Products

Quality of product is a distinctive Guernsey asset. Guernsey milk contains 60% more fat than is required on the government score card, and 30% more food value than ordinary milk. Quality has a commercial value. Consider the insatiable demand for the pure product of the Guernsey cow, and the premiums consumers gladly pay for it. Our free booklets contain valuable information.

THE AMERICAN GUERNSEY CATTLE CLUB, Box H12, Peterboro, N. H.

SON OF NE PLUS ULTRA

We are offering several of his sons and daughters. Also sons and daughters of our other herd bull, who is a son of Golden Secret of Lilyvale and a half brother of Nellie Joy IV, 1,019 lbs. fat. Eighteen of his half sisters average over 600 lbs. fat. Write or come and see them.

W. W. Clark, Vesper, Wisconsin

A YEAR OLD

ANTON'S PASHA OF PROSPECT (61884)
Dropped October 31, 1919
SIRE — Anton's King Confidence (43517). DAM — Buttermaker of Prospect (68769)

Anton's Pasha is one of the "big type" bulls. His picture gives a good idea of his length and the rest of his body is in good proportion.
He is sired by Anton's King Confidence, who has six May Rose crosses. The dam of A. K. C. made 764.65 lbs. fat as a junior 4-year-old.
The dam of Anton's Pasha is now on test and has made 295.87 lbs. of fat in 243 days, while running with the herd, receiving the regular herd rations and being milked but twice a day.
This bull will go mighty soon so if you want him write immediately.

Hoard's Dairyman Farm, Fort Atkinson, Wis.

South Lincoln, Mass.

Sudan Grass Pasture in Kansas

The county agent recently visited the farm of Fred Crittenden near South Haven. Sudan grass had been used on this farm with gratifying results. A small tract of land consisting of about one and one-fourth acres had been drilled to Sudan grass last spring. Twenty-nine head of hogs were turned on this grass about June first. These hogs were unable to keep the Sudan grass down, so that for one period of ten days, ten head of cattle were turned in to eat down the tallest grass. At two other times it was necessary to turn ten head of horses on this tract of ground for a period of five days each. The Sudan grass was mowed once during the season.

Mr. Crittenden made very efficient use of this pasture by turning in cattle and horses when the grass was becoming too large for the hogs, before it became too old and tough so that none of the stock would eat it readily. It was pastured sufficiently so that it was eaten to the ground by the the time of the first freeze. This avoided any loss of feed which would have occurred had he allowed the grass to grow tall and be killed by the first freeze. Mr. Crittenden is well pleased with the results from pasturing Sudan grass this year and he expects to seed a larger acreage next year for pasture purpose.—Sumner County, Kansas, Farm Bureau News.

Value of Organization

"Organization" is the "way and the how" of success, be it a bank, a church, a farm club, or chamber of commerce—nothing except a tattling tongue runs itself without careful control.

When writing advertisers please mention Hoard's Dairyman.

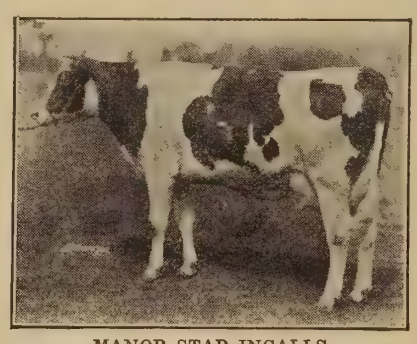
First State Sale



ROCHESTER, N.Y.
JAN. 12-13
1921

A Sale of the Best Individual Holsteins New York State Affords. Every One Individually Selected for this Event

150 HEAD — 63 CONSIGNORS

JOHANNA ORMSBY COUNTESS
First Prize, Senior and Grand Champion at N. Y. State Fair.
Consigned with her young daughter.

MANOR STAR INGALLS
A handsome 26-lb. 2-year-old granddaughter of a 36-lb. cow.
Consigned to this sale.

A Competent Judge has spent more than six weeks in covering the state of New York for the selecting of these 150 head — all chosen with the one thought of maintaining the high ideals of the committee adopted at the start.

In a collection of this class, chosen from so many different herds it is simply impossible to go into detail regarding the breeding of any of the animals — other than to make brief mention. But with a large number of 30-lb. cows, two in particular being above 35 lbs. butter and 700 lbs. milk and scores of young heifers up to over 26 lbs., the discriminating buyer will be able to purchase as good animals as the breed affords. Not only are the animals desirable from their individual and production records, but their calves are also extremely valuable. A special feature of this sale is the unusually large number due right at sale time or very soon thereafter. Every animal of breeding age, not recently fresh handles a calf. There are no blanks so far as has been possible to determine.

Some of the Record Cows Include:

Glycola Korndyke 36.01 — **Edith Segis Korndyke 35.71**
Bonalevo Quality Parthenea 36.00 — **Beaver Dam Mercedes Segis 34.00**

More than a Half Dozen Other 30-lb. Cows
More than a Quarter of a Hundred From 30-lb. Dams

THE HEALTH OF THE ANIMALS in this sale is all that could be wished. Extreme care was exercised in the selections and while it had been planned to give all animals the three tests, it has been found impossible to complete more than the Intradermal and Subcutaneous tests before sale time but in addition to these two tests all animals are guaranteed under a 60-day retest.

Here is a sale in which breeders will be able to find whatever might be needed to strengthen their herds, no matter how good the quality might be now.

The Directors and Secretary of the New York Holstein-Friesian Association unqualifiedly endorse this sale. They are sure it is worthy of the support of every Holstein breeder in the country. Every animal offered has passed a rigid health test by Federal and State officials and every consignor fully guarantees his consignment for sixty days. Every animal has been carefully inspected for type by a judge in whose ability they place absolute confidence. They pledge their reputations as Holstein men that this is a sale of the very highest quality not only with respect to the health of the animals offered, but with respect to the type and conformation, the breeding, the records, and the standing of the men selling the animals. They personally recommend this sale to the attention and patronage of all Holstein men throughout the country who may be seeking good Holsteins for foundation stock or to replenish their herds. As an Association it will undertake to see that every buyer gets a square deal and good value for his money.

New York Holstein-Friesian Association
Syracuse, New York

CARRY ON

OLATHE SIR BESS ORMSBY MERCEDES
BORN JUNE 29, 1920

Canton Illinois

Business, Like A Pendulum, Swings From One Extreme to the Other

We cannot expect our Holstein-Friesian business to be any exception in this period of re-adjustment — all lines are feeling it, but ours has weathered the storm better than any other.

We have reached the end of the downward swing and within the next few months prices will certainly increase and perhaps exceed what they have been in the past.

The shrewd man takes advantage of this "buyer's market" to fill his barns. He buys now at a low price that he may later, when the other fellow wants to buy, sell at a very considerable profit. What are you doing?

Do you know of any commodity that you could keep that would pay you as well as the Holstein cow that fills the pail to overflowing at every milking, and gives you a beautiful calf every year?

The average cow in Minnesota produces 150 lbs. of butter in a year. No doubt the same average would apply in almost every other state.

You know that many Holsteins produce 1,000 lbs. and over.

Why keep scrubs? They cost just as much to take care of — they produce nothing in comparison with the pure-breds — and what do you get for their calves?

Are You A Holstein Booster? I Am.

J. M. HACKNEY

WILSONDALE FARMS

Young Holstein Bulls Backed by Yearly and Seven-Day Records

Herd under Federal Supervision

We have several young bulls up to 17 months of age, sired by Maplecrest Sir De Kol, whose dam made 31.07 lbs. of butter and is a daughter of Daisy Grace De Kol, former World record Junior 4-year-old in the yearly production division.

These bulls are all well grown, and are of show type individuality. They are from dams with records up to 31.70 lbs. of butter in seven days, and 640 lbs. of milk.

Included in the above are a few young calves from 2 to 4 months of age from untested dams, which I will price very reasonable for immediate acceptance.

Prices and full description, with photographs will be furnished upon application.

These calves should be seen to be appreciated.

Mankato Holstein Farms

Offer a Son of

King Colantha Ormsby Bess, A Sir Pietertje Bess Burke combination. Nine dams average over 1,000 lbs.

Dam is going at better than 800 lbs. butter for the year. Has over 25 lbs. butter in 7 days.

This calf was Grand Champion over all bulls at a Southern Minnesota district fair.

Several bulls at prices warranting their use in grade herds.

Write or better still come and see them

(A Federal Accredited Herd)

Marlow & Randall, Mankato, Minn.

Minnesota Holsteins

Miss Korndyke Akkrummer Ormsby 30-lb. 4-year-old. 39.67 lbs. butter at full age. Owned and developed by J. B. Irwin.

For Your Next Herd Sire

get a son of Sir Ormsby Banostine Champion, son of Duchess Skylark Ormsby, world record cow. We have some good ones for sale from dams with good 7-day and year records.

Woodlake & Clover Farms,
John B. Irwin, Station F,
Minneapolis, Minnesota.
"The Home o the Ormsbys."

Grandsons of Sir Pietertje Ormsby Mercedes

The sire is Sir Pietertje Ormsby Mercedes 22d, a son of Minnesota's first 1000-lb. cow. These bulls are all nicely marked, straight top lines. Very good individuals from good A. R. O. dams.
For pedigrees and prices, write

O. J. GROVER, - GLYNDON, MINN

Grandsons of S. P. O. M. 41st and a Few Good Cows For Sale

The cows either have A. R. O. records or are from tested dams, and are in calf to my herd sire, a son of S. P. O. M. 41st. The young bulls are from A. R. O. dams.
Herd under state and federal supervision. Write for complete information to

V. R. HOLMES, - ANOKA, MINN

COME TO BISCAY

for your next purchase of pure-bred or grade Holstein cattle, mature or young stock. Large selection, also a few select male calves to offer. Located near station.

BISCAY SALES CO., BISCAY, MINN.

Lake Shore Holsteins

40 pure-bred heifer calves, 6 months to one year, $150 to $200 this month. Good type, good backing.

E. J. Oppliger, Forest Lake, Minn.

RICHLY BRED HOLSTEIN BULL CALVES

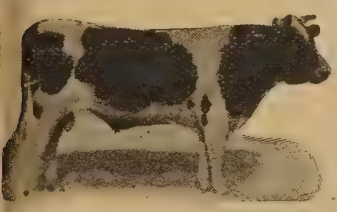
out of A. R. dams and sired by our two richly bred herd sires — **King Piebe Ormsby Mercedes,** a 35-lb. son of Sir Korndyke Bess and every dam in pedigree over 22 lbs. and **King Pietertje Mercedes Ormsby,** a son of Sir Pietertje Ormsby Mercedes and out of a 19-lb. senior two-year-old dam.
Herd tuberculin tested. Write for information or visit herd.

P. FROST SPAULDING FARM CO.
C. L. Spaulding, Mgr., Warren, Minn.

Sir Ormsby Segis Korndyke

grandson of Pietertje Maid Ormsby on sire's side and from a good daughter of King Segis Pontiac Count, heads our herd. Our bulls are all sold but we will book orders for future delivery. We have a few good high grade cows and heifers for sale for cash or on time.

ISLAND PARK STOCK FARM,
Hanscom & Anderson, Props.,
R. F. D. No. 1, St. Cloud, Minn.



Grandsons of "Piebe"

We have for sale a few 5-8 months old sons of Lola Segis Pontiac Homestead, he a 34-lb., 1,000-lb. son of Piebe Laura Ollie Homestead King. Most of them are from good producing daughters of Joe Oak De Kol Fobes, a grandson of Homestead Junior De Kol. Price $125 to $250.

Write us at once if you want one.

RANDALL BROS. Lakeland, Minn.

Just About Ready for Service — $500

(Federal Accredited Herd)

is this bull we offer, and individually as good as his sire, Sir Walker Segis Homestead, first prize yearling bull at Chicago and Waterloo, 1919.

His dam just finished 305-day test with over 12,000 lbs. milk and 500 lbs. butter (2 milkings daily) as junior two-year-old and is a show heifer, first prize two-year-old and champion female at Minnesota's largest county fair and Holstein show (175 head).

Send for pedigree and photo.

A. J. Lashbrook, Northfield, Minn.

Lola Segis Pontiac Homestead

the highest record bull in southern Minnesota, heads our herd. His sire, Piebe Laura Ollie Homestead King, has more daughters that as 2-yr.-olds have produced 20,000 lbs. milk in a year than any other. His dam, a 34-lb. 4-year-old daughter of King Segis Pontiac Count, has 3 records averaging 33 lbs. and has made over 1,000 lbs. in 1 year. We have a few serviceable bulls and younger from A. R. O. dams for sale.

Clover Lea Farm, W. W. Walker, Owner. Austin, Minnesota

MONEY

s Hard to Get. So Are the Right Kind of Bulls!

We have both. Don't go without the bull you need just because money is tight. LET US HELP YOU. We also have a few females. WRITE FOR OUR BARGAIN LIST AND PAYMENT PLAN. Every milking animal in our herd has an official record. We need the barn room. Take advantage of this opportunity. SATISFACTION GUARANTEED.

GRAHAMHOLM FARMS, Holstein-Friesians
Federally Accredited.
H. R. Searles, Mgr., Rochester, Minn.

For Sale
A Few Good Females

Several High Class Young Bulls

I have a few good ones left. Write me at once if you are in the market for a herd sire or a few foundation females.

CHAS. OBY, Maple Lake, Minn.

Sir Korndyke Ormsby De Kol 15th—21 Months Old

His sire is a son of Sir Korndyke Hengerveld De Kol; 51 A. R. O. daughters, one of whom has a 7-day record of 39.56 lbs. and several above 1000 lbs.

His dam has a record of 23.778 lbs. and now on yearly test.

Geo. H. Elwell, - Minneapolis, Minn.

6 Good Cows For Sale

THE MINNESOTA KIND

They are all by a 36-lb. sire, are bred to a son of King Korndyke Colantha Ormsby, and are due to freshen this fall and winter. They are from 3 to 5 years old and absolutely straight and right. Lack of barn room forces us to sell.
Write or come and see them.

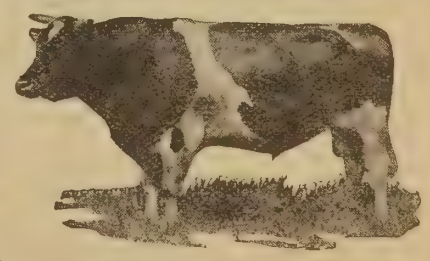
E. J. Brosious, - Stillwater, Minn.

Where is the Best Son

of King Segis Pontiac Count? King Segis Pontiac Fayne Star is "The best individual King Segis Pontiac Count ever sired." His dam is Johanna Fayne Star, 32 lbs. in 7 days, 941 in 365 days. She, the highest record daughter of Sir Johanna Fayne. We like this cross. Send for the bull circular.

Flecks Farms, Faribault, Minn.

For Sale — A Son of "Piebe"



He is King Alice Homestead, a very toppy calf born March 2, 1920.

His dam, Far Oakes Alice Ormbsy, is a 14-lb. daughter of a 25-lb. cow with a 650-lb. 305-day record.

His full sister at just 2 years of age made 18.72 lbs. butter in 7 days and is going at a 750-lb. gait for the year.

His sire is Piebe Laura Ollie Homestead King. YOU KNOW HIM.

Better write or wire today.

He's a bargain at $500 f. o. b. Austin

Minnesota Holstein Co., V. S. Culver, Sec. and Mgr., Austin, Minn.

Bull Calves of Ormsby Breeding

from A. R. O. dams for sale, 2 to 8 months old. Prices $200 to $1,000. We can also offer several good, typy cows bred to a good Ormsby bull. Write or come and see us.

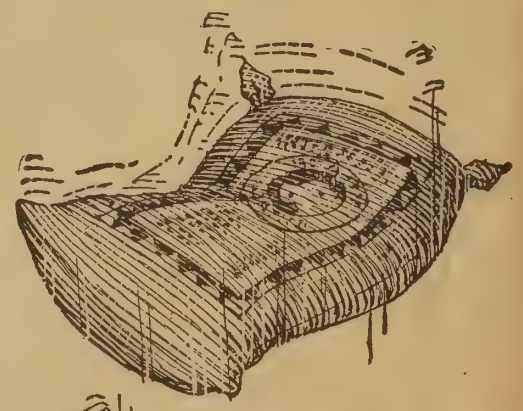
International Feed Prices Are Way Down!

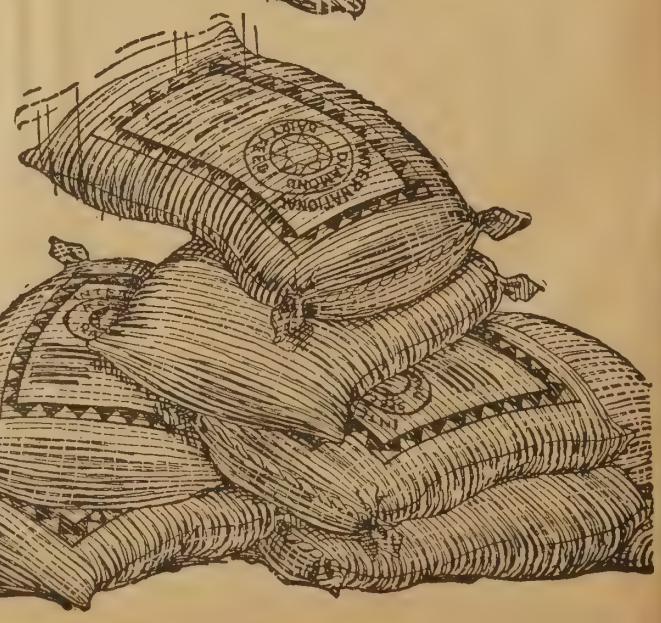
Buy NOW for Continued Feeding Profits

THE things you have to *sell* have taken a decided drop in price. It is therefore fitting that whatever you have to *buy* should come to you at a price that gives you a decent profit.



Prices on International Feeds have been lowered way down so that you may still feed these quality feeds at the same old margin of profit.

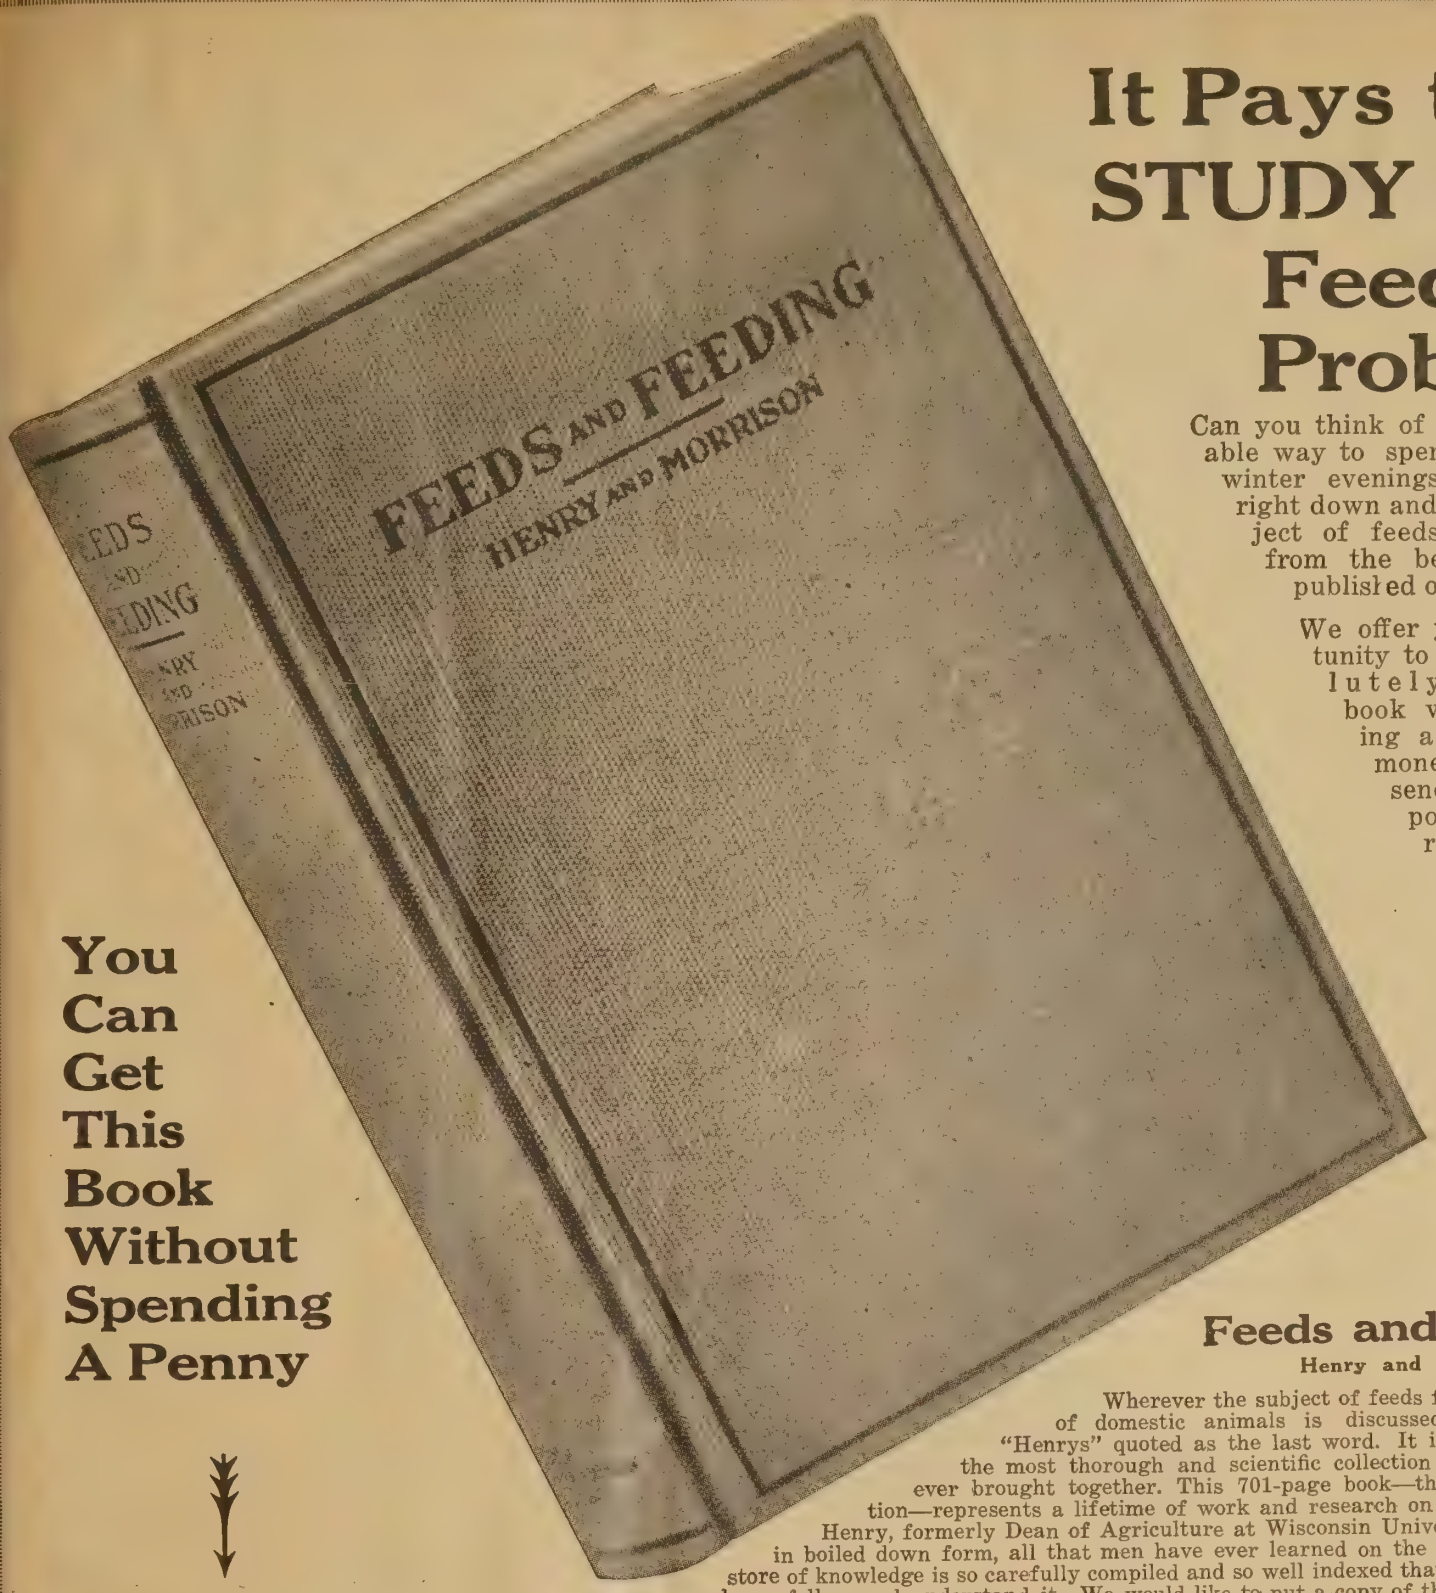
International Diamond Dairy, Special Dairy and Ready Ration are guaranteed feeds. They are well and favorably known to dairymen and stockmen everywhere. Any experienced feeder will tell you that International Feeds are a practical part of the feeding ration if greatest results are to be secured.



Get the New Low Prices

Ask your feed dealer to give you the new low prices on International Feeds. If you have no International dealer near you write us. We will arrange to supply your needs. *Now* is the time to buy.

Quick Sales for Live Agents



Feeders throughout the country will eagerly stock up on International Feeds at the present low price. Scarcely a community but can use a 25 ton minimum carload. If you are alive to business write us for the details of our special low price selling proposition.

It Pays to STUDY the Feeding Problem

Can you think of a more profitable way to spend these long winter evenings than to get right down and **study** the subject of feeds and feeding from the best book ever published on this subject?

We offer you an opportunity to get this absolutely authoritative book without spending a cent of your money. We will send it to you, postage paid, in return for a favor you can easily confer on us.

You Can Get This Book Without Spending A Penny

See Offer Below

Feeds and Feeding

Henry and Morrison

Wherever the subject of feeds for and the feeding of domestic animals is discussed, you will find "Henrys" quoted as the last word. It is without question the most thorough and scientific collection of facts on feeds ever brought together. This 701-page book—the seventeenth edition—represents a lifetime of work and research on the part of W. A. Henry, formerly Dean of Agriculture at Wisconsin University. It contains, in boiled down form, all that men have ever learned on the subject. This vast store of knowledge is so carefully compiled and so well indexed that any man who can read can follow and understand it. We would like to put a copy of this book into the library of every HOARD'S DAIRYMAN reader. Price $3.85.

Here's the Offer:

WE WILL SEND a copy of this 701-page book, postage prepaid, to any reader who will send us a club of just five subscriptions. They may be either new or renewal and either one-year-for $1.00 or three-years-for-$2.00 each. YOUR OWN RENEWAL MAY BE INCLUDED IN THE CLUB.

They're starting right with a De Laval

There are more than 2,500,000 De Laval Separators in daily use throughout the world

DAIRYING with a De Laval Cream Separator has brought prosperity to many thousands of users. No branch of farming is so surely profitable as good dairying, with its steady cash income every month in the year and no waiting for crops to mature.

But the cream separator means everything in good dairying and either saves or wastes cream.

The De Laval saves cream twice a day, 365 days a year. It skims cleaner; produces smoother, better cream; lasts longer, and is easier to clean. It pays for itself the first year, and may be bought on such liberal terms as to save its first cost while being paid for. There is a size for every need.

Start the new year right with a De Laval.

There is a De Laval Agent near you.

AN EIGHT-LETTER FORMULA FOR SUCCESS

FROM "HIRED MAN" TO FARM OWNER IN SIXTEEN YEARS

SUNKISTON, SENIOR SIRE AT BIRCHWOOD

Thirteen of the dams in the first 4 generations of his pedigree average 582 lbs. fat.

IT'S a long step from farm hand to farm ownership. The majority do not attempt it; many try but fail to span the distance and fall midway into land tenantry; a few courageous ones, giving no heed to what lies between, keep their eyes on the goal and succeed at last in gaining clear title to a farm home. These latter furnish the incentive which makes worthwhile men willing to begin on agriculture's bottom step; their example strengthens ten thousand in their determination to reach the top—to own a farm.

M. L. Welles of Wisconsin is known from his own town to the borders of the Badger State as a successful dairy farmer. He owns a productive, up-to-date farm. His home is thoroughly modern, his barns well equipped, and his herd of Guernseys pure-bred and of high quality. Yet he is one of those who but a few years ago worked by the month as a "hired hand". His success is no happenstance; it has been gained step by step through a certain, definite formula he has never failed to follow. There is nothing complicated about this formula. It is familiar to everyone, but many do not appreciate its close relationship to getting results on a dairy farm. It has only eight letters. None of the eight are in "neglect", only two are in "carelessness", five are in "liberal rations", and as many are in "farm grown feeds".

A Farm Hand in 1904

Sixteen years ago when Mr. Welles was employed by the month by Charles L. Hill, he made good. He gave full service. He didn't spend much time worrying about wages, but put in his time getting results. He was soon made a partner in the farm business, which he held for a year and a half before tackling the breeding of cattle for himself. A farm of 158 acres was purchased without making a payment, it seeming necessary to use his savings as working capital in the form of eight pure-bred Guernseys and a number of grades. That was in 1904. On his own farm, he continued the plan which had made his services valuable to others. When other men stopped their teams and leaned over the line fence to pass the time o' day, Welles worked. When neighbors were yet in bed, Welles was about his morning chores. Night found him reading, planning, that his efforts might be intelligently directed.

A Good Start by 1909

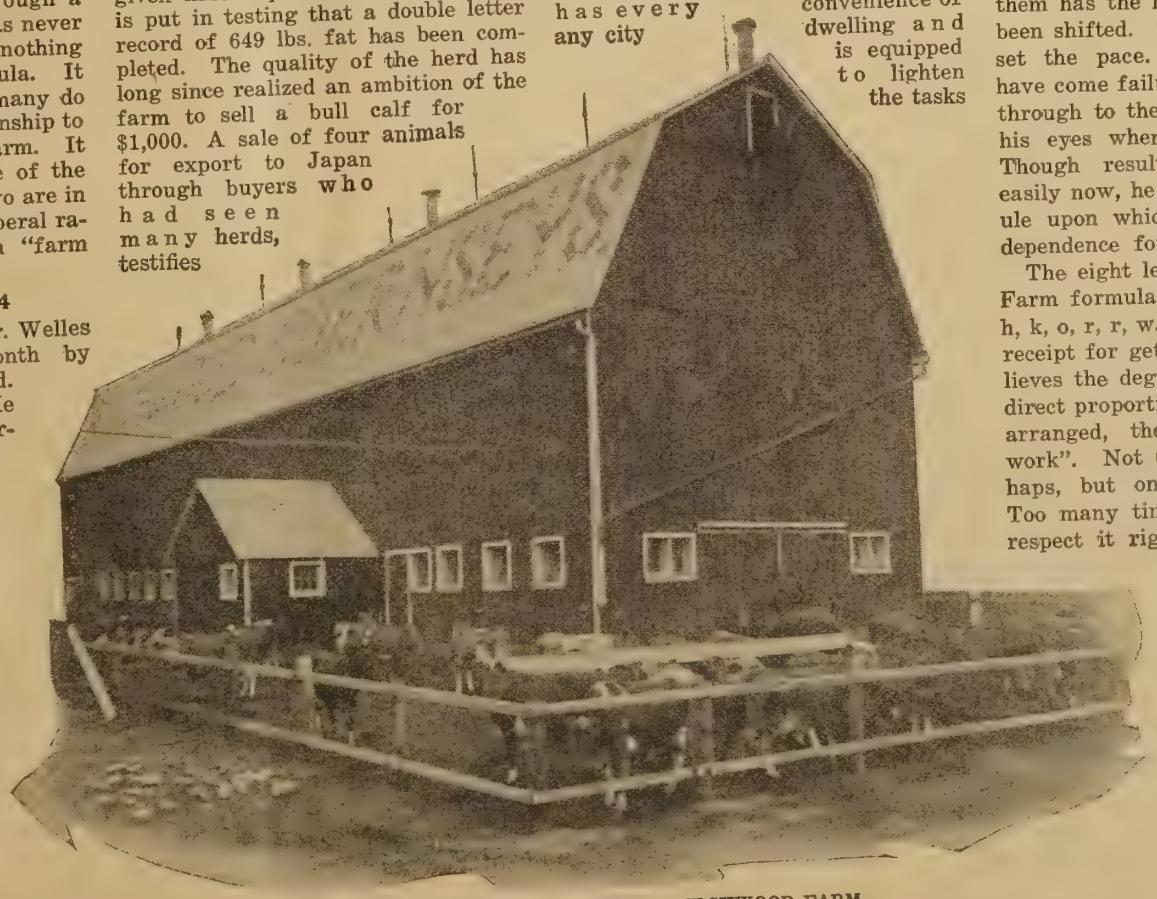
Hill's book, "The Guernsey Breed", records that by 1909, five years after the farm was bought, the herd, then half pure-bred and half grade, was on such a standard that, averaging 39½ cows during the year, its cream sales totalled $4,109.

From the beginning good sires were used, painstaking study determining each choice. The first was Penwyn 2nd, a bull with nine Advanced Register daughters. Sunkiston, the present senior sire, has thirteen dams in the first four generations of his pedigree with records which average 582 lbs. fat. The junior sire, Star of Destiny, is from a dam whose two-year-old production was 503 lbs. fat and whose mature record is 647 lbs. fat. From the first, too, Advanced Register testing was done. Mr. Welles says, "Testing—we must stick to it even if large records are not made. People want to know what they are buying." While consistent breeding records are given first importance, enough effort is put in testing that a double letter record of 649 lbs. fat has been completed. The quality of the herd has long since realized an ambition of the farm to sell a bull calf for $1,000. A sale of four animals for export to Japan through buyers who had seen many herds, testifies to the results of Mr. Welles' efforts in building a herd. At present there are fifty Guernseys on the farm, nearly all of them pure-bred.

In 1912 the owner of Birchwood was nearly enough "out of the woods" that a modern 128 by 36 foot barn was built with stanchions for 48 cows and box stalls for bulls, calves, and freshening cows. Monolithic silos, 14 by 39 feet, store succulence and alfalfa and clover fields supply legumes to fill the spacious mows. This strictly modern equipment evidences the standards which are set on Birchwood Farm. What is done, is done well. The barn is arranged for efficiency so that each minute's effort brings results. It was not enough that long hours should be spent with the herd; Mr. Welles wanted those hours to net accomplishment. Therefore, the new barn. Nor do the returns from this investment come altogether in the elimination of unnecessary steps. The cows are more comfortable and produce more liberally because of the improved care it is now possible to give them.

When the new barn was completed to make the care of the herd easier and furnish comfort to both the cows and their keepers, the homemaker of the farm was not neglected. The farm house at Birchwood has every convenience of any city dwelling and is equipped to lighten the tasks of one who is ever busy on a dairy farm.

OPPORTUNITY OF BIRCHWOOD, A DAUGHTER OF STAR OF DESTINY



As a two-year-old she milked as much as 42.5 lbs. in a day.

There is a feeling on this farm that success may not be measured in dollars alone—that the years are not well spent unless there is provision for living the full life the country permits. The home is such as to make the strenuous activities of the day worth while. There is comfort there, too, and all those small conveniences which take the drudgery out of the life of the one who has equal share in the success of Birchwood with the master of the big, modern barn.

"Out of the Woods" in 1920

Today the farm, the new barn, and remodelled house, and the herd are paid for. In the sixteen years this has taken, Mr. Welles has been constantly on the job. He has been chore-boy, herdsman, and manager. The farm's two tenant houses have sheltered many helpers, but to none of them has the heavy end of the loads been shifted. The owner himself has set the pace. With the successes have come failures, yet he has fought through to the goal on which he set his eyes when yet a "hired man". Though results are secured more easily now, he still follows the schedule upon which he early placed his dependence for success.

The eight letters of the Birchwood Farm formula for success are: a, d, h, k, o, r, r, w. They are Mr. Welles' receipt for getting results and he believes the degree of attainment is in direct proportion to its use. Properly arranged, the letters spell "Hard work". Not a beautiful motto, perhaps, but one for accomplishment. Too many times it is not given the respect it rightfully claims, for the richest rewards of man come through his labors. Mr. Welles has made a pleasure of the stern demands of dairy farming. His is the satisfaction which comes to him alone who has made his own way unaided—from the bottom to the top.

THE BARN AND GUERNSEY HERD ON BIRCHWOOD FARM

FIRST COUNTY TUBERCULOSIS-FREE

Barron County, Wisconsin, Completes Area Test, Finding One-half of One Per Cent of Its 67,000 Cattle Diseased

DECEMBER 29, Barron County, Wisconsin, celebrated the first county-wide tuberculosis clean-up ever made. The work was completed December 23 when the last of 5,000 herds were tested. In a total of 67,000 animals, the number of reactors averaged slightly over one-half of one per cent—one in about two hundred.

This first all-county test was put on by the Wisconsin Department of Agriculture following the filing of a petition signed by over 50 per cent of the cattle owners of Barron County. The work, begun last spring, has been done by an average of six men and sets a new record for speed and efficiency in testing large number of cattle. It was conducted without direct expense to the farmers themselves and at a total cost to the state of about 35 cents for each animal tested. The per cent of diseased animals discovered is the lowest ever found in such an area and brings forth the declaration by Dr. J. P. West, in charge, that Barron County has less bovine tuberculosis than any other area its size in the United States.

"Tail Test" Used

The intradermal test made possible the quickness and cheapness of the Barron County clean-up. This consists simply in the injection of 4 or 5 drops of tuberculin between the two layers of the skin and observing whether or not a swelling results. The injection is usually made in the soft skin on the under side of the tail. Seventy-two to ninety-six hours afterward, examination is made. If a swelling is observed, the animal is adjudged diseased. The great advantage of this test is the rapidity it permits, one man being able to take care of four or five times as many animals in a given period as by the usual subcutaneous method in which reactions are detected by rising temperatures. As proved in Barron County one man can give the intradermal test to as many as 700 animals in a week. The maximum number with the subcutaneous test under like conditions would be 145 to 180 animals. In November six men tested a total of 9,707 cattle in 641 herds.

Every Check Made on Test

The low percentage of reactors found so amazed the men in charge that every possible check was made on the efficiency of the method used. Slaughter examination of reactors showed lesions in a satisfying percentage of cases. Some of the first herds tested have been injected again and serve as a check. The subcutaneous and ophthalmic or eye test methods were used in a number of cases as checks and only served to verify the findings by the "tail test". It is noteworthy, also, that in another Wisconsin county where 45,000 animals were examined for tuberculosis intradermally, the average number of reactors was 6.38 per cent.

Both Dr. J. P. West and Commissioner of Agriculture C. P. Norgord are convinced that a reaction to the intradermal injection in experienced hands is fully as indicative of the presence of the disease as any other test or any other combination of tests. It is strongly emphasized, however, that only experienced men can accurately "read the test"—and that the temperature curve of the subcutaneous method is more easily interpreted.

The Test of the Farmer

Barron County has an unquestioned lead in tuberculosis eradication. Her herds are as clean as one complete test can make them. No other such area now has proof that its cattle have as little of the disease. But the job is really only half done. The meeting held December 29 had the double purpose of celebrating what W. L. Hauser, President of the Wisconsin Live Stock Breeders' Association, termed a "singular and exceptional progressive movement" and also of laying plans for keeping the area clean. Herein lies the test of the farmer himself—whether he will maintain the great advantage this county-wide test has given him and see that the disease is kept out of his herd in the future. Commissioner Norgord drew the attention of Barron County farmers to the benefits from accredited herds and the fact that this county-wide test has carried them half way to the accredited list. He said: "I congratulate you on the progress already made and recommend that you cinch that progress by going ahead now and making your herds accredited." He pointed out the obligation of Barron County to the state to maintain the condition made possible by the use of the $18,000 state appropriation. Dr. West presented the regulations adopted by the Live Stock Sanitary Board for controlling transfers of cattle within the county and the introduction of new cattle into the county. The meeting approved these regulations, accepting them as laws to be enforced.

These provide that transfers and introductions of cattle must be reported within 48 hours. Cattle from accredited herds can be received without testing if proper certificate is furnished. Other cattle must be accompanied by a certificate of health issued by a recognized veterinarian and must be retested within ninety days. Calves purchased below testing age must be isolated until tested. Only animals which have passed the test within a year can be transferred within the county. An amendment offered by Mr. Hauser was unanimously approved. It provides that in cases where infection is found or strongly suspected in animals within the area the entire herd shall be retested to do away with the chance that the disease may gain headway in a herd which may not be tested at regular times.

BARRON COUNTY HOLSTEINS

Now Up to Barron County

While these regulations have the effect of laws and can therefore be enforced it is recognized that enforcement rests on the farmers of Barron County. A united public sentiment will keep the county clean by forcing each man to protect himself and his neighbors by keeping his own herd free from tuberculosis. The state has done its part; it is now up to the farmers of Barron County. The present general feeling of enthusiasm was indicated at the celebration meeting in the resolution passed expressing appreciation of the labors of R. L. Cuff, former county agent, who was largely responsible for securing the county-wide test, and pledging help to W. A. Duffy, present county agent, to "carry on the good work of keeping the county tuberculosis-free."

A Lesson for Buyers

A valuable lesson may be drawn from a study of the probable source of the disease among the reactors discovered. While the number of infected animals is extremely low, due probably to the fact that the cattle population of the county is relatively new and largely native, the reactors which were discovered were chiefly animals shipped in and those which were in close contact with them.

Demand for Other County Tests

Farmers owning nearly a quarter of a million cattle in other counties have signed petitions asking that the Department of Agriculture undertake further clean-up campaigns. Work is now under way in Lincoln County, where 424 herds containing 4,279 animals were tested in October and November. Out of this number slightly less than one-half of one per cent of reactors has been found. Bayfield and Ashland Counties have petitions in, with over fifty per cent of their cattle owners signed, and Burnett, Washington, Polk, and St. Croix have petitions in circulation. An appropriation of $75,000 is sought for the coming year by the Department of Agriculture for a continuance of this area test work.

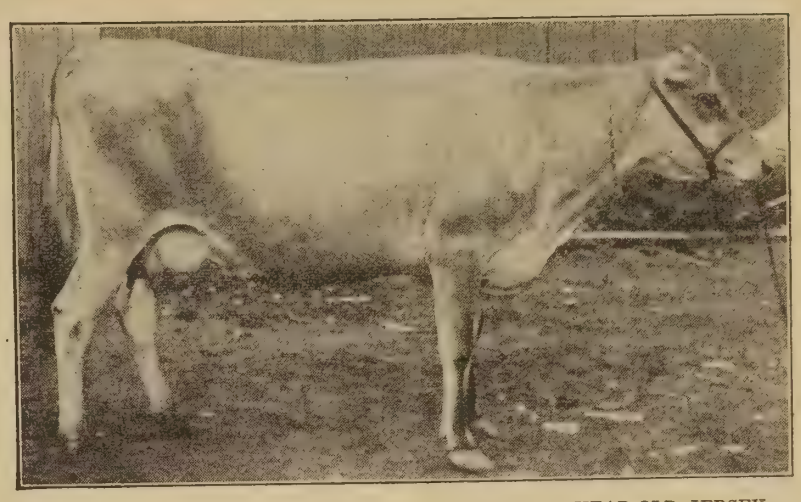
REPRESENTATIVE GUERNSEYS IN THE FIRST COUNTY TO COMPLETE A COUNTY-WIDE TEST FOR TUBERCULOSIS

Buying a Proven Sire

HOARD'S DAIRYMAN:—The tendency now is to buy calves for our herd sires. I do not know why this is except we are afraid of old bulls. I have noticed lately quite a few buyers looking for the proven sires. I was on one farm where there were two bulls which had been bought when they were seven years of age and by a very prominent breeder, also.

Now, if our most prominent breeders see it this way, why not give it some thought? Consider a sire of about five years of age, clean and right, who has daughters which have proven their producing ability in A. R. work. Why is he not a better buy than a youngster who has not started to breed yet? Of course he is, and he can be bought probably cheaper than the youngster. The way to buy a bull is to see his dam and grandam, if possible, or buy a proven sire when you can see his daughters and know what you are buying. Proven sires can be had that will save you money. Look them up.

Washington. F. S. STIMSON.



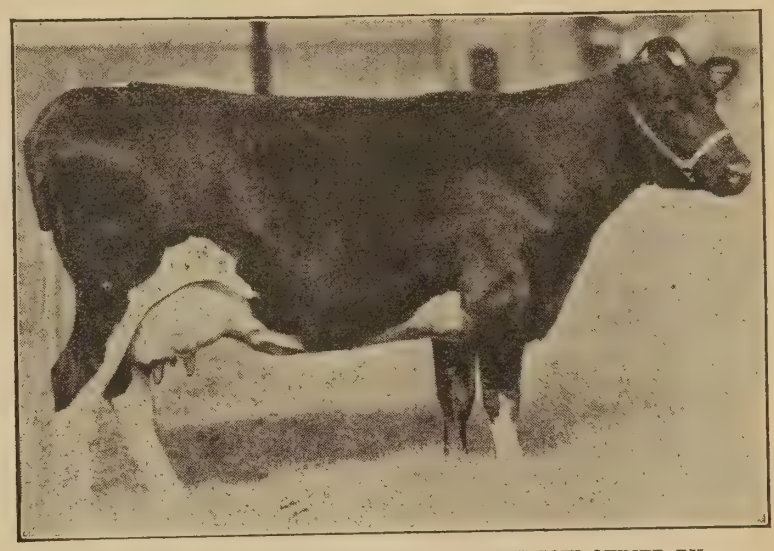
The farmer who has kept careful records knows at the end of the year how his business has gone; the man who hasn't kept records merely guesses.

HIGH PRODUCERS FROM SIX STATES

EMINENT'S FOXY BELLE, GOLD MEDAL JERSEY COW OWNED BY WAIKIKI FARM, WASHINGTON

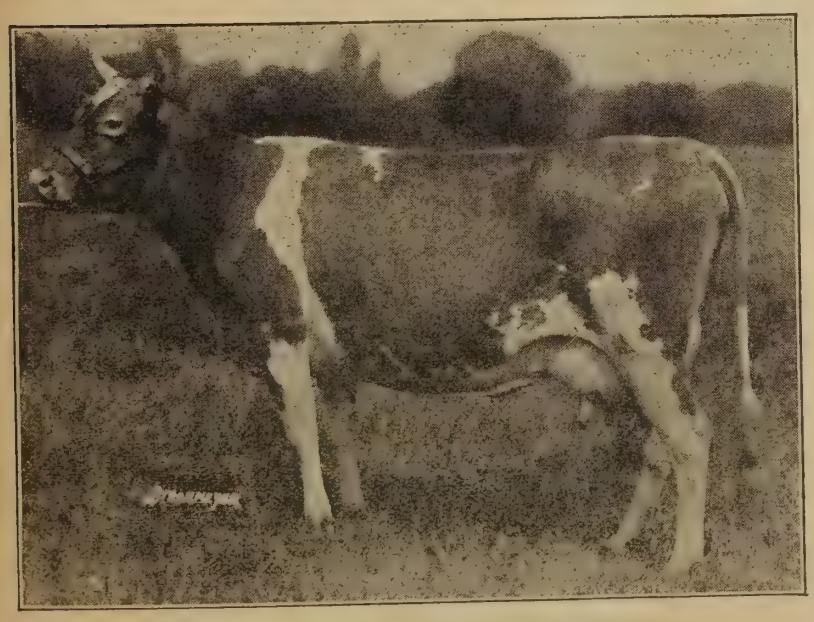
She stands third among three-year-olds with a production of 14,920 lbs. milk, 816 lbs. fat. She is a daughter of Eminent's Pilot, the tenth Gold Medal bull, the sire of 14 R. of M. daughters, three of which are Gold Medal winners.

BLUE BELLE'S SOPHIE, CHAMPION SENIOR THREE-YEAR-OLD JERSEY OF TENNESSEE, OWNED BY C. S. BLANKENSHIP



Her year's production was 8,075 lbs. milk, 471.53 lbs. fat, exceeding that of the former champion by 67 lbs. fat. During the period of the test she was shown, winning grand championship at the Rutherford County Fair.

MARSHIE D. V., CHAMPION FOUR-AND-A-HALF-YEAR-OLD GUERNSEY



Marshie D. V., Guernsey cow bred and owned by William H. Rutherford, New York, now heads the list of four-and-one-half-year-old Guernseys with a record of 14,729.9 pounds of milk, 915.05 pounds butterfat. Her fat record is 4.38 lbs. above that of the former champion, Dairymaid of Pinehurst, the first to head class B.

As a three-year-old the new record holder produced 12,038.7 lbs. milk, 691.61 lbs. fat and held tenth place in class E. Her sire is May King of Maplehurst, a grandson of Imp. King of the May.

BESSIE LYONS HENGERVELD 2D, HOLSTEIN COW OWNED BY J. H. KETTLE OF TEXAS

In seven days she has produced 590.3 lbs. milk containing 22.33 lbs. fat. She gave 2,196 lbs. milk testing 3.7 per cent her first month. At present she is producing about 85 lbs. per day. The Kettle herd is as yet very small but a good beginning with high class individuals is already made. At least one other good short-time record has been completed.

PRINCESS ULTRA GRACE, A GUERNSEY COW OWNED BY W. H. GRATWICK, NEW YORK

She has qualified for eighth place in class E by producing 14,340.9 pounds milk, 713.41 pounds fat, in the three-year-old division. The new class leader was bred by Burnside Farm, Maryland, and purchased by Mr. Gratwick from George M. White, New York. She is a daughter of Ne Plus Ultra and out of King's Grace, an A. R. daughter of King Francis.

LADY DU CHENE, A GUERNSEY COW BRED, OWNED, AND DEVELOPED BY R. H. L. CHICHESTER, VIRGINIA

She has qualified for third place in class BB of the Advanced Register by completing a record of 13,712.0 pounds milk, 670.8 pounds fat, in the four-and-one-half-year-old division. This makes the fifth daughter of King of Chilmark to qualify for class leadership. She has a previous record of 12,768 pounds of milk, 640.98 pounds of butterfat, completed in the three-year-old division.

POT LUCK OR SILOS

JAS. COLLEY, ILLINOIS

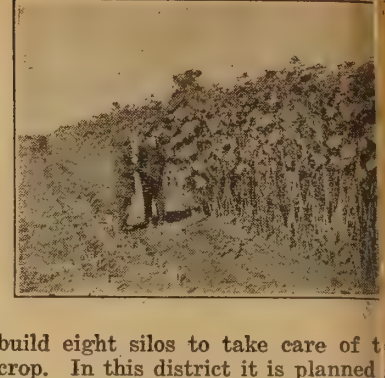
THE use of sunflower fodder has been taken up earnestly in the Prairie Provinces of Canada. In no other country, it is safe to say, has this crop been grown over so wide an area and under such varying conditions. It has been grown on farms that are only just across the international boundary line, and on farms nearly four hundred miles north of this line; on the low lying plains surrounding the Red River Valley in Manitoba and at an altitude of 3,600 feet in the foothills of the Rockies. At all these scattered points, results surprisingly good to the growers have been harvested—results which promise to revolutionize the dairy industry and live stock business of the country.

As is to be expected in a matter of this kind, the experimental and demonstration farms of the country, whether operated by the Dominion, or the various Provincial Governments, or by such concerns as the Canadian Pacific Railway, have been to the fore. They are giving the crop a thorough trial on fair-sized areas, varying from five to forty acres. On many of these farms sunflowers have been planted this year for the first time, but on others this is the third or fourth year in which they have been grown. Hundreds of farmers in different parts of the three provinces have also planted ten to twenty acres each this year. They have all harvested good crops and all speak enthusiastically about the heavy yields of this new fodder.

The demonstration farms have, of course, kept more accurate records of their experiments than the average farmer could be expected to keep Advice from six of these farms in various parts of the provinces of Manitoba, Saskatchewan and Alberta shows that on each, from five to forty acres have been devoted to this crop and that the yields have varied from six and a half to nearly forty tons of ensilage to the acre. On the University Farm at Saskatoon, in Central Saskatchewan, they have grown sunflowers in each of the last four seasons, obtaining yields from eight to twelve tons to the acre. This year they planted forty acres to this crop and harvested about three hundred and twenty tons of fodder. It was exceedingly dry in this part of the Province during the summer, but the sunflowers stood up very well and gave, under the circumstances, a very satisfactory yield.

On the farm of the University of Alberta at Edmonton, which is more than three hundred miles north of the international boundary line, two fields were planted, one of which was cut about the end of August and yielded twelve tons of fodder; the other, cut about a week later yielding twenty tons to the acre. On the Dominion Government experimental farm at Rosthern, near which town Seager Wheeler, the famous wheat wizard, also has his farm, five acres yielded forty tons of fodder. Approximately the same yield was obtained at Scott, which lies a little farther to the South, while at Indian Head, situated on the main line of the Canadian Pacific Railway and about a hundred miles north of the boundary line, somewhat better yields were obtained during two years of trial.

Sunflowers have been an exceedingly good crop at the Manitoba Agricultural College at Winnipeg, the yield being from thirty to forty tons to the acre during each of the two years they have been planted there. These yields are similar to those obtained on the Canadian Pacific Railway's Supply Farm at Strathmore in Southern Alberta. Here, from between twenty and forty acres planted in each of the two last years, yields of about thirty-four tons to the acre were harvested last year and about twenty-eight tons this year.



So much for the yields on the experimental farms. Even the smallest of them represent a good paying crop. The larger yields indicate very profitable returns. But, on the whole, farmers generally seem to have better luck than the experimental stations. Yields of from fifteen to twenty tons have been common with them.

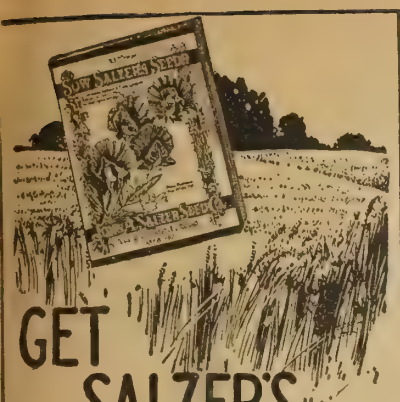
As to the feeding value of the sunflowers it is again necessary to rely on the records of the experimental stations. Three years' trial at the Saskatchewan University farm has shown that sunflower silage compares favorably with corn silage, having at least an equal feeding value. At the Manitoba Agricultural College extensive feeding tests were made last winter by feeding dairy cows with sunflowers, corn, and other ensilage. It was found that the milk flow of these cows was slightly heavier after being fed on sunflower silage than any other ensilage. The increase did not amount to much, but it was there just the same. Moreover, during the sunflower feeding period the cows gained more weight than they did at any other period. Professor G. H. Hutton, on the Canadian Pacific Railway Farm at Strathmore, says that he had a similar experience with the cows of the pure-bred Holstein herd maintained there. Their milk flow slightly increased, and the cows gained slightly more weight when given sunflower ensilage than when fed on ensilage made from corn or on peas and oats.

Up to the present there has not been much experience recorded in Western Canada of the feeding of beef steers with sunflowers. At the Government Farm at Scott in Saskatchewan, however, they used their ensilage in this manner last year. A number of feeders were bought at one of the public stock yards and some were given an addition of twenty pounds of sun flower ensilage to a ration consisting of wheat straw, five pounds of turnips, and a meal mixture consisting of one part of each of oats and standard screenings. The sunflower fed steers made an average gain of 42 pounds each daily, more than the other steers, and the sunflower ensilage was determined to be worth $13.82 per ton.

The experience with sunflowers previous to this season has nearly all been gained on the demonstration farms, but so satisfactory did the farmers consider these results to be that this year areas of from ten to twenty acres were planted on numberless farms throughout the country. Many planted the crop just to see how it would grow and about the middle of the season they were faced with the prospect of a large quantity of valuable fodder on their hands and no means of utilizing it. This necessitated their getting busy and building silos. Many others, of course, made arrangements for the building of their silos simultaneously with the planting of the crop. As a result, this large country, over which one could previously travel for days and never see a silo, is becoming dotted with these towerlike structures, and it may not be long before a farm in Western Canada without a silo will be almost as much of a curiosity as a farm with a silo has been in this country.

In one dairy section in Southern Alberta a number of farmers planted about fifty acres of sunflowers between them last spring and had to

build eight silos to take care of t crop. In this district it is planned plant more than a thousand acres the crop, and build at least a hundr silos next year. In other dairy s tions of the country similar resul have been obtained and similar pla made for the coming season. Nor this movement confined to dai farmers. The owner of one of the lar est Hereford herds on the continer whose ranch is in the foothills of t Rockies, is now feeding his nurse co on sunflower silage, having erect two silos of one hundred and fif tons capacity each, which he has fill with sunflowers grown on twen acres of land. Next year he w more than double his acreage of th crop and will erect two or three silo and intends to use the silage t following winter for feeding some his pure-bred cattle. And at least o sheep breeder is going to supplemer the winter rations of his flock wit this silage, which he has put up in tw cement silos of about two hundre tons capacity each.



Sunflower silage promises to solv the question of winter feed in Wes ern Canada. The success or failur of all branches of the live stock in dustry hinges upon this questio With large areas of unoccupied lan available, on which large quantitie of hay could be cut for nothing bu the cost of cutting and on which cattl could rustle all the year round with out expense to their owner, the winte feed question did not bother the farm er and rancher very much in the past but with the steadily increasin settlement of the country, resultin in the land being fenced and culti vated for the production of grain an other crops, the question promises t become more acute every year. Bu if results as good as those already ex perienced can be looke forward to in the fu ture, sunflowers and si los will insure a larg supply of fodder ever winter, and stock wil not have to trust to th pot luck of the range It means a steady ad vance of Western Cana da's already importan live stock and dairy in dustry.

TEN ACRES OF SUNFLOWERS ON FARM OF THOMAS & SON, LLOYDMINSTER

"Shelter will doubl the life of farm ma chinery," says O. R Zeasman of the Agri cultural Engineerin Department of the Uni versity of Wisconsin "If farmers would onl keep the rain and rus away from their imple ments, they would b surprised to see hov much trouble would b saved.

"Rust can cause many troubles. For ex ample, an adjustmen may become so badl rusted that it cannot b used. It is often dam aged or broken in loos ening."

GET SALZER'S CATALOG

WHEN you order farm or garden seed from Salzer's catalog you receive not only seed but service as well. You know the importance of planting vigorous seed. That is just the kind of seed the Salzer Service guarantees you.

Our modern trial and propagating grounds at Cliffwood are dedicated to your service and to our purpose to furnish you the best seed that nature can produce and man select. Because of our rigid tests we guarantee all Salzer Vegetable and Flower Seeds to be satisfactory to the purchaser in every respect or we will refund full purchase price any time within six months.

Send for our new catalog and plan your garden with the aid of its beautiful plates showing hundreds of choicest Salzer strains in true colors. A postcard will bring it.

New York Breeders Meet

HOARD'S DAIRYMAN: — The New York State Breeders' Association opened with a statement by President Huson that there never was so favorable a time for the farmer to dispose of scrubs in all lines of live stock and put in their places a proportion of pure-breds. The prospect for pure-bred animal husbandry is now the best we have ever known.

A new sheep specialist, Professor Grams, has been engaged at the college. He spoke at the convention, mentioning the fact that since 1840 we have decreased the number of sheep in New York State from over five million, to a little over a half million. The cheaper lands of the west, first just West of the Alleghanies, then further west, took the sheep industry away from us. Now those lands have pretty well closed up and some increase in flocks is due in New York. Here it is likely to take the form of small flocks of 40 to 50 sheep on farms where some roughage would otherwise go to waste. He stressed the importance of keeping better sheep and taking better care, particularly during the first six months of their lives. The next important item according to our specialist is the better grading of the wool and better form of bundle when marketing.

E. L. Moody, president of the state federation of wool growers, spoke of the 34 county units that have entered the federation for the purpose of a state pool of the wool, much of which is already in storage in Syracuse. He also sees the importance of efficiency in grading.

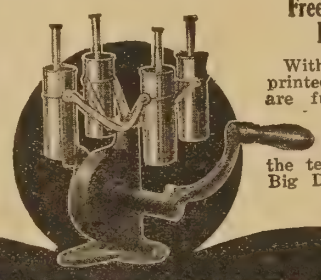
The head of the veterinary college, Dr. Moore, perhaps our best authority on bovine tuberculosis, said he had spent years to get people to believe in tuberculin as a diagnostic agent. Now it will take him the remainder of his life to caution against its indiscriminate usage. Not all veterinarians are adapted to making proper conclusions from appearances following its use. The accredited herd plan is sound, but proper supervision is essential.

Mr. McLaury, head of the division of animal husbandry, is fully committed to the accredited herd plan. We have no more tuberculosis than other states but we have a bad reputation. To market our stock in the future we will have to make sure of freedom from tuberculosis. Our markets are mostly out of the state. Area work is now in order, and the farm bureau managers have agreed to work for the employment of county veterinarians.

At the state college we have as vice director of extension, Professor Burrett, who gave a very enthusiastic account of the farm bureaus. He called the farm bureau not just another "organization" but a really new service organization. It is a partnership affair of the federal government, the state, and county and the individual farmer. It is in charge of trained agents and it has a definite program. It is primarily educational, not commercial. Even the American Farm Bureau Federation is not a direct commercial agency, but to give service in formation of co-operatives and in investigation of economic problems.

The commissioner of foods and markets, Dr. Porter, gave a very sound address. What we want, he said, is a steady flow of commodities, and that means storage. We require better farming, better business, and better living. The first of these we already have to a considerable degree, although there is always a chance to improve in all lines. The second, so far as we are concerned, comes from co-operation, and the third will result from the others. In co-operation there must be a contract that binds

(Continued on page 1097)



$6.95 BUYS A CREPACO Babcock MILK TESTER

Don't Keep Boarder Cows!

Appearances are deceiving. The cow you think is best may be unprofitable. The man who **knows** is the man who succeeds. The Crepaco Babcock Tester shown below will point out the unprofitable cow. It will enable you to buy cows with open eyes. It will enable you to secure adequate remuneration for your milk and cream.

Free Glassware, Etc.

For $6.95 we furnish a high grade, accurate, 4-bottle testing machine, one acid measure, pipette, two brushes, one bottle acid, and instruction sheet. Everything complete for testing.

Free Instructions Furnished

With each machine printed instructions are furnished which are plain and simple. A child can make the tests. Write for Big Dairy Catalogue.

"Dandelion Butter Color" Is Big Prize Winner

Be sure and use Dandelion Brand Butter Color and give your butter that June golden shade which brings top prices —pleasing the eye and tempting the palate.

The High Scores of 1920

In many of the State Buttermakers' Shows, first awards were won by users of old reliable "Dandelion Brand." You can't miss by giving a trial to the butter color which helps 90% of the successful buttermakers of America.

Never gets rancid. Doesn't affect flavor.
Doesn't color the buttermilk. Leaves no sediment.
Colors more butter to the gallon.

Dandelion Brand Butter Color is purely vegetable and fully meets requirements of all Food laws—State and National. Ask your jobber for prices.

WELLS & RICHARDSON CO., Inc. BURLINGTON, VERMONT

Feed your crops as you feed your stock

Every farmer knows how the "balanced ration" has revolutionized the live stock industry—how scientific feeding has made cows give more milk, steers fatten quicker, pigs grow faster, hens lay more eggs. Correct relation between the *digestible* protein, carbohydrates and fat has proved the secret to maximum results and greater profits.

There is a parallel between animal and plant nutrition. Crops grow faster, develop more fully and yield more abundantly when plant foods are "fed" in forms that are readily and steadily *available* from germination to maturity.

But, each crop should have the "ration" suited to its particular needs, just as each class of animals requires a certain ration. There is a "Double-A C" fertilizer for every crop and every locality.

This company maintains an Agricultural Service Bureau for the purpose of helping you increase the yields and improving the quality of your crops. Actual field tests are made yearly in every section. Our representative knows soil and crop conditions in *your* locality and will gladly suggest what fertilizers you should use. Write—ask us any questions. Also ask for booklet *"How to Get the Most out of Fertilizers."* It's free.

Grind Alfalfa-Grain-Fodder

Dairying Thirty Years Ago

Taken from the Issue of Hoard's Dairyman of January 2, 1891

There seems to be a "Call" to write among the literary dairymen of late. Result—we have more communications than we can handle this week. They will keep.

⚜

The 19th annual report of the New Hampshire State Board of Agriculture says there are 39 creameries in that little state, 17 of them having been added during the past year. They produced 2,250,000 pounds of butter and paid for milk and cream, $500,000. The Granite State Dairymen's Association, encouraged by a small appropriation, has been enabled to promote the dairy interests of the state effectively. Oleo has a hard time there, for it cannot be sold even under the United States License unless it is colored pink—and pink is nice in a posy but is not yet a fashionable tint for butter.

⚜

"There is nothing so valuable on the farm as a good milker, and probably nothing so rare," says E. P. Smith. "It is profitable to keep a good milker, but it is an annual loss to keep a poor one. This applies to the one or two cows found on all small farms, as well as to the flocks that the large dairy farms own. A good milker depends largely upon breed, but not exclusively on this. Individuality is also an important factor. One cow of a good breed will often give a much larger supply of milk than another one, although her surroundings and nourishing food is not any different from the rest of the herd. The breed and individuality of a cow thus really determine the amount of milk that she will produce. A good cow is one that will make the most of the food given to her. She will assimilate the food properly and convert a good proportion of it into milk and butter properties. Others of the same breed will convert it into fat or bone. Those cows evidently are not intended for the dairy and it would be unprofitable to keep them on a farm. No matter how much feed nor how well the ratio of nourishing and butter producing feed is maintained, the milk supply will not increase in sufficient proportion to the quantity and quality of feed given to make the high feeding experiment a success. The rule, then, may be laid down that while feed rich in butter making materials given to poor cows is a very unprofitable business, it is equally unprofitable to keep good dairy cows and not supply them with an abundance of material from which to produce milk."

⚜

Buttermilk is in much greater demand as a summer beverage than sweet milk. As a therapeutic agent it is given now to sick person when nothing else is a lowed. It is a powerful nerve toni Buttermilk is now considered bette than sweet milk for persons incline to dyspepsia because one of the diffi culties of milk—its slow digestiv qualities—is removed at once as but termilk has already gone through on process of digestion. Iced buttermill is a fashionable fad now. Ladies of fer a glass of buttermilk to thei friends in summer just as they do th "cup of tea" in the winter.—Field ani Farm.

⚜

Professor Hunter Nicholson praises the "cup of pure cream at breakfast every day" as a delicious prescription for weak digestion or delicate lungs; and deems it possible on this basis, and with business enterprise, especially among the owners of Jersey cows, to increase the cream-trade a hundredfold in all cities and large towns.

Dairy Markets

Elgin, Ill., Dec. 29—Butter steady; 28c. Sales large.

New York, Dec. 28—Butter—The usual dullness incident to the holiday season has been the conspicuous feature of the week's trade. Receipts of Pennsylvania creamery are light and prices are fairly sustained on the basis of 29@29½c for extras. Western receipts are still running very irregular in quality. For heavy bodied, high flavored Iowa, Wisconsin, etc., 29c. Elgin goods at 30c. State dairy has shown no change worthy of mention. The few sales extras were at 22c.

Cheese—The business with home trade has been light and entirely of a jobbing character. Recent sales are reported in the northern part of the state at 8¼@9c. Some really fine parcels can be had at 9¼c and prime factories at 9@9¼c. Chenango Co. part skims are held a shade firmer; sales of choice lots to home trade at 6½@7c.

CARNATION PIONEER SEGIS

THE Holstein-Friesian heifer, Carnation Pioneer Segis, owned by the Manikowske Farms, North Dakota, has broken the world's record for fat production in the junior two-year-old class of the seven-day division, producing in seven consecutive days 415.6 lbs. milk, 24.877 lbs. fat. She displaces as world champion two-year-old the Canadian heifer, Het-Loo Pietertje, whose production for seven days was 24.260 lbs. fat and the American champion, Fairview Korndyke Pietertje, whose production for seven days is credited as 24.146 lbs. fat.

This world record heifer is sired by Johanna McKinley Segis, a son of King Segis and Johann DeKol Van Beers, the second cow in the world to produce in excess of 32 lbs. fat in seven days. Her dam is a 30-lb. daughter of Sir Clyde, the sire of a number of high record cows.

Carnation Pioneer Segis was fitted for her record and fed and milked throughout her record breaking test by P. J. Schmit, herd manager at Manikowske Farms and who has developed many other high record cows.

Make pork cheap to sell at high summer prices

Along the

Seaboard

the south's newest great railway

On the farms along the Seaboard peanuts, cowpeas, soy beans and clover are abundant from July on. The farmers have hogs to sell at high summer prices when other sections have none.

Come to the prairie land along the Seaboard Air Line where there are low priced lands, all-year pastures and home-grown concentrates. The average acre of peanuts makes about 400 lbs. of pork—sweet potatoes make 700 lbs. Pioneering opportunities without their hardships. Livestock, general farming, fruit and vegetable growing pay well. Write for information.

Cheese Markets Inactive

[Report by U. S. Bureau of Markets.]

Reports from all quarters indicate that trading during the week ending Dec. 18 was almost at a standstill. Aside from supplying regular trade, and this mostly in small lots, comparatively small amounts of goods changed hands. Even dealers who are hard pressed financially found little response when prices were lowered practically to cost. In fact, some reported receiving but few orders at prices quoted which represented actual losses to them.

The distributing trade is apparently well stocked, and many who would ordinarily be buyers at present prices are not interested because they are trying to move their own holdings of higher cost goods. However, unless business improves and support is given the market from some source it would not be surprising to see prices go still lower, as some pressure to sell is being felt.

Storage Reductions During November

The monthly cold storage report shows that holdings of American type cheese in the entire country on Dec. 1 were 40,096,106 lbs. This is some 22,000,000 lbs. less than the stocks of Dec. 1, 1919, although about 15,000,000 lbs. more than those of Dec. 1, 1918. The November, 1920, reduction was 8,500,000 lbs., and while this was about 1,500,000 lbs. less than the decrease during November, 1919, when holdings were excessive, it more than equals the change during November, 1918. There is no apparent concern regarding present stocks.

The average wholesale prices on American cheese (style Twins) for the week ending December 18, 1920, and for the corresponding week last year were as follows:

	Week ending Dec. 31	
	1920	1919
	Cents	Cents
New York	27.50	31.50
Chicago	22.63	30.32
Boston	24.50	31.50
San Francisco	25.29	30.31
Wisconsin Boards	21.25	30.21

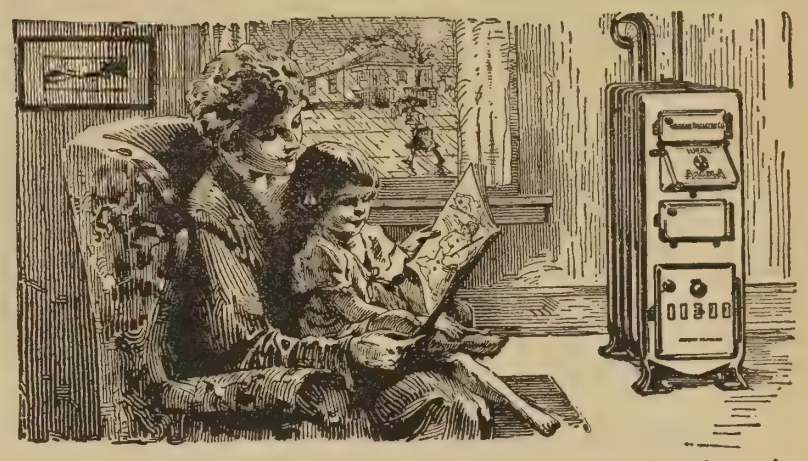
The receipts of American cheese for the week at the four markets first mentioned and at Philadelphia totaled 2,770,336 lbs. as compared with 2,452,338 lbs. a year ago and 2,557,052 lbs. last week.

New York Jersey Breeders Endorse Pooling System

New York Jersey breeders at a meeting December 16 unanimously adopted the following:

"*Resolved* that the New York State Jersey Cattle Club in annual session at Syracuse hereby heartily endorses the co-operative plan and so-called pooling system now being organized by the Dairymen's League."

The following were elected officers of the club for the ensuing year: Harry S. Gail, president; R. L. Bielby, vice-president; and M. A. Clark, secretary-treasurer.



New York. C. O. GOULD.

Pierce County, Wisconsin, Guernsey Sale

A county wide Guernsey campaign has been brought to a successful finish in Pierce County, Wisconsin. In a sale, 33 head brought an average of $420; 18 of the animals being under one year of age. These Guernseys were purchased in New York State and brought to Pierce County for distribution through public auction.

Albert Kline bought the highest priced animal in the sale, Kathergay Crocus, for $1,200. The second highest animal was Kathergay Polyanthus, purchased by John Gipford for $720.

Protected from Winter Blasts

With an IDEAL-Arcola Heating Outfit the farm home becomes the equal of the finest city mansion

All rooms are heated from one fire and with great fuel saving—outlasts the building—no other feature or equipment of a home will do so much for yourself and your family. An IDEAL-Arcola is an investment and not an expense.

IDEAL-Arcola Heating Outfits

Any Dealer will furnish in sizes to suit rooms and climatic conditions.

For Soft Coal	No. 1-B	Size IDEAL-Arcola with 100 sq. ft. of Radiation	$142

EDITORIAL COMMENT

SKIMMILK FOR CALVES

A farmer who feeds whole milk to a calf after it is a few weeks old does not fully understand the value of skimmilk. A calf should have whole milk till three to six weeks old, but after that skimmilk is quite as good. It is very expensive to feed calves butterfat at 57 cents a pound.

We appreciate that there are breeders who hold that whole milk should be fed to calves until they are eight to ten months old. They feel that it develops a better calf. There is no question but that for the first 3 to 5 months the whole milk calf will have a little plumper appearance and its coat will be a little sleeker than the skimmilk calf, but at the end of eight months if the skimmilk calf is otherwise properly fed it will have a smooth, glossy coat of hair, will be well developed, and will change, from the feeding of skimmilk to roughage and grain entirely, better than the whole milk calf. The skimmilk calf will be fully as large if not larger than the whole milk calf. This has been the experience of many successful breeders of pure-bred live stock. One thing is sure, there is not enough difference between skimmilk and whole milk to warrant any dairyman, desiring a profit, to feed butterfat to his calves when it is worth 57 cents a pound. Such men should buy a hand separator for the purpose of separating their whole milk and feed the skimmilk while it is warm and fresh to their calves, chickens, and pigs. Skimmilk, according to the price of hogs, is worth at the present time 50 cents a hundred. Chickens will return more than this and for grade or pure-bred calves it has a value of from 50 cents to $1.00 per hundred.

BETTER CREAM

At the 11th annual convention of the Oregon Butter and Cheesemakers' Association, held recently in Portland, the importance of producing a high quality butter was emphasized. Much discussion was devoted as to how to make good butter from rather inferior cream. Neutralization and pasteurization were discussed by those well informed upon this process of making butter. It was emphasized that it is the best policy for farmers to send sweet cream if they wish their product to command the highest price on the market, that by using fresh cream it will not be necessary to resort to chemicals. It was pointed out that sometimes old cream is not sour but has a very bad taste and odor and its flavor will not permit the production of good butter.

There is no subject of greater importance to the dairy industry today than quality and we believe creamery buttermakers' associations and other dairy organizations can well afford to point out the evil effects of poor cream and how essential it is that sweet cream be delivered if the highest quality of butter is to be produced. The difference in price between the finest grade of butter and what is termed "first" and "second" is sufficiently large at the present time to warrant any dairy or creamery to put forth some effort to produce butter that will command the highest market price.

The creameries we believe should grade cream and pay according to its quality. Paying a uniform price for all grades of cream is an evil practice and is not encouraging the production of a better quality of cream. One of the largest creameries in the United States will not accept poor cream and its success is very marked. Its butter has sold for ten cents a pound more than some brands of creamery butter. Its success leads us to believe that cream grading can be and ought to be done.

HAIRLESS PIGS AND GOITERS

It is not uncommon for farm animals in the northwestern states to be born defective in some way or other. Pigs are born without hair, and calves, goats, and lambs with goiters. The Montana Agricultural Experiment Station, under the direction of Dr. Howard Welch, has done considerable experimenting to determine what causes these defects in new born animals, but so far it has not been determined just what the cause might be that produces these unsatisfactory results.

We surmise that the cause of defective animals may be attributed to a faulty or imperfect ration, some substance lacking in the feeds, but, as Dr. Howard Welch says, "The most puzzling feature is the variation in a single pen of pregnant sows. Some of the sows may produce normal, vigorous litters while others will be hairless or weak and die in a few hours."

It has been observed in herds where most of the calves are born normal that some of them are born with goiters. This peculiar malady is confined to certain areas although there are times when normal animals are produced in these areas.

So far experimental feeding has not revealed a ration that has prevented the occurrence of defective new born animals. The time will undoubtedly come when rations will be made that will produce normal animals in all instances. It has been found, however, that by the feeding of potassium iodine to the dam during the period of gestation that normal animals will be produced. A cow should be fed about 2 grains of potassium iodine daily in her ration during her period of gestation. Sheep and swine should be fed about 1 grain of potassium iodine daily. Dr. Welch, in his bulletin reporting the work done to determine the causes and remedies for hairless pigs and goiters in young animals, says: "We feel justified in advocating the feeding of iodine to pregnant domestic animals in sections of the Northwest where goiter is prevalent."

THE REWARD OF STRUGGLE

"God never crowns natural gifts or faculties. To him that overcometh is given the victor's palm." We have only to look about us; bring to our minds our acquaintances and friends to be convinced of this statement. It would almost seem at times that most of the failures in life are among those with the greatest natural gifts. The student in school receiving the highest standing may well be concerned about his future success; the person of natural social attainments may well watch his step lest the sophistry of people deceive him; the person able to accomplish any task with ease, confidence, and satisfaction to himself may well consider the number who have failed because of similar attainment and conception. Natural gifts are dangerous, for the human being does not grow strong or develop character without a struggle.

There is no branch of agriculture which imposes larger and more exacting duties than dairy farming. Successful dairymen are men of attainment, of courage, and of power, for they "overcometh and carry the victor's palm". There are those who would make life's pathway easy; they would free the world from struggle and strife. To permit them to make this change, even though it were possible, would be to invite disaster.

Dairy farmers are apt to complain of the confinement which their vocation demands; of its many problems; and perhaps of its hardships; but take away the very things which seem the most objectionable, and with them happiness and contentment will also disappear. Men receive their true happiness, their greatest enjoyment, in overcoming obstacles, in solving their problems, in accumulating their fortunes, and not in using the rewards of their labor and sacrifices. What stands in the way very often of happiness and contentment are natural gifts or indifference to improvement. Men, whether engaged in farming or some other business, who start from humble beginnings but with a desire for service and success; men who are willing to struggle, to overcome, those are the ones who reap a harvest of happiness and contentment and are "given the victor's palm".

THE WOOD LOT

The prices of fuel, lumber, and fence posts are such that the farmer can well afford to pay more attention to his wood lot. This part of the farm has been neglected because it was considered unprofitable to pay any attention to giving the new trees an opportunity to grow or cutting out the old timber and generally clearing up the underbrush and fallen timbers in the wood lot. It is quite as necessary to clean up the underbrush as it is to weed the corn field, if young trees are to make proper growth.

Trees will not do well when grown too close together. Permitting live stock to run in the wood lot is not conducive to the development of young trees. Fire produces losses which can usually be avoided if a little attention is given to clearing up the brush and the fallen trees. It is the practice of some to attempt to grow grass in the wood lot for the purpose of furnishing pasture to young stock but when this is done the trees are not close enough together and the timber production is materially reduced. There are places on almost every farm which will give little return and can be used for no other purpose except for the growing of timber for fuel, posts, and lumber, and we are strongly of the opinion that the farmers can, with profit, give more attention to their wood lots.

A very good bulletin entitled "Care and Improvement of the Farm Woods", has been published by the United States Department of Agriculture. It may be obtained for the asking by writing to the Forest Service, Washington, D. C.

A Test Ration Wanted

I am feeding and testing some cows for seven-day test. I wish you would figure out a ration from the following feeds: Ground oats, corn, bran, oil meal, cottonseed meal, beet pulp, beets, molasses, and alfalfa hay, also corn silage.

I have been getting a good yield of milk, but it does not test much. I would like as high a test as I can get with those feeds. Those heifers are Holsteins and will average 1,450 lbs. in weight.

Rock Valley, Ia. W. C. S.

Our experience with cows teaches us that a ration may very well be advised for semi-official testing with considerable surety that it will work out as planned. Seven-day testing is altogether a different proposition. The record which a cow will make in seven days depends very much less upon the particular feeds she secures during that period than upon the feeds which have been used in preparing her for test. Of course, high short-time records depend a great deal upon the tester, but we believe these records are as much made during the preceding weeks and months as during the seven days when the test is actually being conducted.

This question of influencing fat percentages is a very interesting one. It has been proven that certain changes in a ration will temporarily affect this percentage, but no one has found out a system which is reliable even for short times. It is a common practice to feed a very narrow grain ration for seven days, in which such feeds as cottonseed meal play a prominent part. There are some cows, however, which are not affected at all by such abnormal rations. Because of the great variation in the reaction of different cows to these abnormal rations and because we have felt that the long time test is very much more valuable, we make no recommendations for seven-day testing, particularly when the cows have been already fitted for test.

The feeds listed are splendidly adapted to dairy feeding. From the concentrates a palatable, nutritious, milk-making mixture can well be compounded. We suggest that a mixture of 300 pounds of ground corn, 200 pounds of ground oats, 200 pounds of bran, 100 pounds of oil meal, and 50 pounds of cottonseed meal, fed rather liberally to these Holstein heifers, should give good returns. As much alfalfa should be furnished as they will

consume and about 30 or 35 pounds of silage per day.

Molasses will serve its best purpose with those cows which it is desired to stimulate to their maximum consumption of feed. It is an appetizer and has its value in this fact rather than because it furnishes its high carbohydrate content at an economical figure. Corn supplies carbohydrates more cheaply, therefore the only use we suggest for molasses is with those particular cows which are being crowded. It is best supplied by diluting it and sprinkling it over the hay allowance.

Whether beet pulp or fresh beets should be used depends upon the supply and upon the cost, one giving quite as good returns in most instances as the other. Each in its succulence is very valuable in testing. With the pulp, we would feed five to seven pounds per day, soaking it about twelve hours before feeding in three or four times its own weight of water. If fresh beets are fed results will be quite as good, and some feeders claim somewhat better. As much as fifty or sixty pounds may be supplied these heifers per day.

The quantity of grain supplied may be regulated according to the feeder's judgment of the individual cow's reaction to the feeding of grain. Under practical conditions where economical production is the consideration, an allowance of one pound of grain for each three and one-half or four pounds of milk produced will be sufficient.

A Company Lease

A company of four of us are buying a 1,700-acre dairy farm in Michigan. The farm is all fenced and cross-fenced with all No. 9 woven wire 48 inches high. Pastures are well watered by streams and barns are watered by two good flowing wells. Streams furnish all electricity wanted for farm use. It has 65 acres in good alfalfa and an abundance of clover and blue grass. It has three good houses, a large, strictly up-do-date dairy barn, a large young stock barn, large hog and chicken houses, besides other good buildings, all practically new. It is equipped with horses, registered Holstein cattle, sheep, hogs, and chickens; also all necessary machinery, wagons, silo filler, milking machine, tools, etc, etc. The entire equipment is furnished by the company and its appraised value shall be left on the place at the expiration of the lease.

Two of the company of each buy a third interest in the farm with its equipment, the other two buy the remaining third together. The two buying the one-third interest together wish to operate the farm for a term of years. They bring to the farm only their household furniture and are to furnish all the labor for operating farm and are to have vegetables, milk, cream, butter, eggs, and wood from the farm for their own use without cost.

We expect to sell cream that will be shipped from a station on the farm. What would you consider a just share for the tenants to receive from all products sold from the farm?

Chicago, Illinois. T. L. K.

We will assume that the members of the proposed company are A, B, C, and D, the last two to be the actual operators of the farm and to own a one-third interest also.

Such a lease as proposed would seem to us cumbersome, and it certainly would be unusual. To carry it into effect on the basis of a half share lease would require a very detailed system of bookkeeping and would offer large opportunities for disagreement and misunderstanding of its necessarily complicated provisions.

The simplest guess that we could make is that A and B each might receive one-sixth to one-fifth of the income and increase, while C and D will receive as their partnership share from three-fifths to two-thirds of the income and increase.

We would suggest that, if possible, the proposition be so simplified that the company will own the real estate and one-half of the productive live stock. Have C and D purchase for their own account the work, stock, tools, and implements, and one-half interest in the productive live stock. This might be arranged on the basis of the exchange of notes or in such other manner as would put the ownership and operation of the farm under the general rule that is common in share renting. The income of the farm and the increase in productive live stock would then go half to the company and half to the partnership of C and D. In actual settlement this might mean that A and B would each receive one-sixth, while C and D would each receive one-third.

Possibly making a concrete illustration will help the understanding. Assume that the real estate is valued at $201,000, the tools, equipment, and work stock at $12,000, and the productive live stock at $9,000. In this case, the investment of each of the four members of the company would be as indicated in the following table:

	A	B	C	D	Total
Real estate	$67,000	$67,000	$33,500	$33,500	$201,000
Tools, etc			6,000	6,000	12,000
Live stock (as rented)			2,250	2,250	4,500
Live stock (as company landlord)	1,500	1,500	750	750	4,500
Total	$68,500	$68,500	$42,500	$42,500	$222,000

In the division of returns and increase of live stock, C and D would share as owners of the real estate and also as operating tenants. Assuming that this return amounts to $12,000, the company would receive $6,000 as owners and C and D would receive in addition $6,000 as partnership tenants. In actual division this would be as follows:

A—one-third of $6,000	$2,000
B—one-third of $6,000	2,000
C—one-sixth of $6,000 (as owner) plus one-half of $6,000 (as tenant)	4,000
D—one-sixth of $6,000 (as owner) plus one-half of $6,000 (as tenant)	4,000

In other words, A and B would each receive one-sixth of the income and C and D would each receive one-third. If C and D are operating the farm as partners and possibly putting in different investments of capital and labor, the partnership would then get two-thirds of the income and this would then be divided between C and D according to such special agreement as they may have.

Our issue for February 6, 1920, contains considerable information on the basis of a good dairy farm lease and also different forms of leases. No single lease is directly applicable to every case, but adaptations can be made that will be valuable in arriving at an equitable and just division of responsibilities and profits.

Pasture Mixture

Kindly advise me of a pasture mixture for a glady or rocky hillside. This is lime stone soil but a great deal of rock is on the surface. I would like to know what to sow to resist drouthy weather. I want to sow some sweet clover in the spring. Have my ground broke. When is the best time to sow, how much per acre, how many crops will it produce the first year, and how long will it live?

Festus, Mo. E. J. J.

It would be difficult to obtain very much pasturage under the conditions described. The soil is evidently very shallow and because of this, together with the fact that it is sloping, it must get very dry at times during the summer. There are not very many grasses of value that will withstand this condition, but fortunately some will do it better than others. If it is possible to work up a seed bed, a mixture of brome grass, red top, and orchard grass will probably give as good results as can be expected. These would all be better than blue grass as this grass does not resist dry weather very effectually. Of the three grasses referred to, brome grass is probably the best. At the time the seed bed is prepared, we would apply some stable manure. This will make it easier to get a catch of grass. The best time to seed the mixture would be in the fall and winter rye might be used as a nurse crop. Five pounds of red top, together with ten pounds of each of the others, should be sufficient. However, if a seed bed cannot be worked up, there is little that can be done to make this hillside into a satisfactory pasture.

Sweet clover may be seeded in the spring as early as possible with a small grain for a nurse crop. Use about 25 lbs. of seed per acre, and secure the hull-less seed if possible. It will probably not yield very much the first year, excepting perhaps some pasture. The second year there should be two crops if it is handled properly. The first cutting should be made before the plants blossom and there should be a high stubble left, say about six to eight inches. A second crop may be expected. Sweet clover only lives two years and since it takes the first year for the crop to establish itself, there will not be more than two cuttings.

A Farm Cheesery

We have a larger supply of milk at our dairy than we can dispose of at present, and ask that you please give us some information in regard to installing a cheese equipment to make cheese, and if it is very practicable to make cheese in small quantities. I will appreciate it very much if you will give me a list of equipment and the cost of same if possible for installing a small unit.

Manchester, Ga. W. W. A.

In case you are located near a large city market, or within easy shipping distance, the manufacture of Neufchatel cheese is quite profitable, as from 100 lbs. of whole milk you will get about 20 lbs. of cheese, which is commonly put up in 3 or 4 ounce packages and retails at 10 or 15 cents a package. This figures at 10c a package to about $8 per hundred for the whole milk. The necessary conditions are that the milk shall be clean and sweet so as to make a good quality of cheese and that you can keep the cheese cold while it is in your possession and ship it once or twice a week fresh to the retail stores where it is sold.

This cheese must be eaten fresh, as it becomes rather strong in flavor after five or ten days, unless kept very cold. However, there are a number of consumers who prefer the cheese when it is rather strong flavored.

There should be sufficient vat room to hold the milk and a little steam for heating the vat to the required temperature. The milk is thickened with rennet and the next morning the curd is run through the gate of the vat into bags which are hung up and drained for 24 hours. The well drained curd is pressed for one-half hour the next morning, and is then ready to mix with salt and other flavoring materials and pack at once in packages for sale. It requires no curing at all.

In case you have no nearby large city market where such soft cheese can be retailed, I would advise you to manufacture American cheese or possibly Brick cheese, which require several weeks or months for curing and will keep well and can readily be sold to any grocery store or to cheese dealers in any of the large cities.

Another way to dispose of your milk would be to run it into a separator and use your cream for ice cream or butter and make cottage cheese of the skimmilk. The cottage cheese would have to be shipped to a large city where consumers would soon learn to eat all that you could make.

J. L. SAMMIS.

Feeding Roots to the Stock

HOARD'S DAIRYMAN:—Many small farmers who do not have silos find it profitable to raise and feed considerable quantities of roots during the winter. There is an especial need for such feed to properly balance the ration if no silage is available. Not only is this true in the case of the dairy cow but it is also true with almost all kinds of stock. Sheep are particularly fond of all kinds of roots and the same is true of horses. Succulent feed of some sort is needed by all animals and this can be supplied in a very palatable form in the shape of roots.

We have raised mangel beets, turnips, and carrots for the stock and believe we have been more than paid for the labor required. Of mangels, the Long Red has proved the best. The carrot from which the largest yield of stock roots has been obtained is the White Belgian, a short variety which grows one-third above ground. This is easy to harvest and is much liked by stock. There are several varieties of turnips which yield heavily. This year we sowed the Purple-Top Globe broadcast about the middle of August and harvested an immense crop.

In feeding roots to milch cows, we find the best time of day is just after milking in the morning. At this time we have fed all kinds without any trouble with the milk. Some claim turnips cannot be fed to cows giving large quantities of milk but this does not seem to be the case with us. During the cold weather it is not a good plan to feed roots taken directly from the cellar or storage pit. Such roots are only slightly above the freezing point in temperature and we do not think it good practice to give them to the cattle at that stage. Our plan has been to bring the roots from the cellar over night and keep them in a heated room, then in the morning they are cut and fed to the cattle. If roots are fed regularly, about one-half peck daily is sufficient for milch cows. Yearling calves and young stock should have about the same. Feeder steers and bulls may be given larger feeds.

Carrots are excellent for horses. Farm animals which do not have to work hard during the winter may be kept on considerably less grain if plenty of carrots are available. Six or eight quarts of cut or chopped carrots daily will go a long way towards feeding a horse when he is not working. Carrots and mangels are excellent for sheep, also, and are particularly valuable just before lambing to serve as a conditioner for the ewes. We always feed roots rather finely cut, believing it is better to put in a little extra work than to take chances of choking the creatures.

New Hampshire. C. H. CHESLEY.

New Low Prices on Feeds

[Report by U. S. Bureau of Markets.]

Very poor export demand for high protein feeds caused a decline of several dollars per ton in these commodities during the week ending December 18. Other feedstuffs declined in sympathy, and practically all registered new low records for the year.

The trade in general reports lack of interest by their customers and does not look upon conditions as favorable for much change in the near future because of the continued use by feeders of locally produced grain and forage.

Bran declined $1 or more and was quoted as follows: $25 at Minneapolis, $29.50 at Chicago, $27 at Kansas City, $36 at Boston and New York, $38 at Atlanta, and $44 at San Francisco. Middlings average about $2 a ton less than bran.

Cottonseed meal quotations given in many markets are nominal asking prices, and bids of $2 per ton under these enabled buyers to obtain their supplies. Forty-one per cent meal was $33 at Kansas City, $34 at Minneapolis, $37.50 at Chicago and Buffalo, $30 at Memphis, $40 at Boston, and $41 at San Francisco. The 36% meal averaged about $3 under these prices.

The trade reports a fairly good demand for linseed meal in mixed cars. Offerings are heavy and sales were made at $43.50 Philadelphia and $41 delivered Chicago. Quotations ranged from $40 in Minneapolis and Omaha to $44 in Boston and New York.

Gluten feed prices are unchanged and several mills are shut down. Quotations range from $48 in Chicago to $55 in New York. Hominy feed remained steady at $31 in Minneapolis, $35 in Chicago, and $42 in Boston. Beet pulp is quoted at $40 in Chicago, $44 in Minneapolis, and $48 to $50 in the East. Cocoanut was $25 in San Francisco, rice bran $23 in St. Louis, brewers grain $44 in Milwaukee, and flour middlings $28.50 in Minneapolis.

The hay market was dull, with timothy one dollar lower and alfalfa $2 lower than last week. No. 1 timothy ranged from $19 Minneapolis, $27 Chicago, $29 Philadelphia, to $38 New York. Mixed hay was about two dolllars under these prices with clover still one dollar cheaper. No. 1 alfalfa was quoted as follows: $21 Omaha, $22 Kansas City, $23 San Francisco, $26 Minneapolis, $28 Chicago, and $37 Jacksonville.

CONSUMERS'

Live Stock Most Profitable

That recent sales indicate that the market is excellent for the buyer, and that the future has very good things in store for Wisconsin live stock breeders were included in predictions by B. H. Hibbard, agricultural economist at the University of Wisconsin, in commenting upon the outlook for live stock husbandry.

"It is perfectly true," said Mr. Hibbard, "that we have relatively few animals in proportion to the population of the country at the present time. This means most distinctly that live stock is, during the next few years, destined to be high enough in price so that it will pay very well to keep and raise it. Farmers who have no pure-bred stock, or who could profitably add a few more head of good stock to their herds, have a splendid chance to buy now at reasonable prices. Breeders, who have the grain just now and who can sell it in the form of live stock, will undoubtedly make more profit than they would be likely to make if they should hold the grain for future sale. While much of the live stock that has recently been marketed has eaten grain so high in price that the breeder may think he has fed at a loss, so far as the present and immediate future is concerned, the feeding should result in a profit."

Whether or not a breeder can do better by selling the grain to the market or to market it by feeding to live stock depends somewhat on the adaptation of the country to the two systems of agriculture, according to Mr. Hibbbard. Grain pays best, of course, where the country is especially adapted to its production, and the same is true of live stock breeding. At the same time there is no large margin between grain and live stock production in a large section of country where the production over a period of several years is under consideration. In other words, live stock certainly does pay in the long run.

"There is always more or less of an increase or decrease in the relative profitableness of live stock and grain marketing, over a period of years," Mr. Hibbard explained. "If grain pays better than live stock, then live stock tends to become scarce. If live stock production pays better than grain, then the later becomes relatively scarce. Neither of these conditions can hold for any length of time, because one must balance the other. That either grain or live stock farming should completely and permanently outdistance the other is unthinkable. At present it seems perfectly clear that producers of live stock have a very good outlook for the future."

Idaho Imports Jerseys

December 8th, 69 head of registered Jerseys were sold in Payette County, Idaho, for $15,000 at public auction. This sale, together with 43 head sold last May for $10,000, gives this county a strong start in Jerseys. Previously the county has been famous for its fruit. The animals in the recent sale were brought in from Washington, County Agent P. T. Fortner and F. R. Cammack selecting them. Banks advanced enough to hold the cattle until sale time and gave the purchasing dairymen a year's time for the payment of the notes given in the sale. Nine calves purchased for the Fruitland Jersey Calf Club for an average of $100 have been distributed to boys and girls of the club.

The proven sire, Brookuna's Manson, was purchased by the Jersey Breeders' Association for $300. The proven sire, Adelaide's Sultan, was sold for $570 to George Eldridge who has fifteen of his Register of Merit daughters. Sultan's Lady Belle, with a two-year-old record of 483.24 lbs. of fat, was sold to C. W. Young for $605, topping the sale. Only two other animals reached the $500 mark, these being Glendale Lyuna, purchased by L. P. Dorothy for $500, and Sultan's Pogis Onwa, purchased by C. H. Sargent for $550.

Coming Events

Jan. 11—Wisconsin State Horticultural Society, Madison.

Jan. 11-12—Certified Milk Producers' Association of America meets at Ansonia Hotel, New York City. Sec.-Treas., Harry B. Winters, Albany, N. Y.

Jan. 11-13—Wisconsin Dairymen's Association, Madison, Paul C. Burchard, Secretary, Fort Atkinson.

Jan. 10-14—Annual Farmers' Week at Purdue University, Lafayette, Ind. The annual meeting of the Indiana State Dairy Association will be held Jan. 13.

Jan. 11-12—Michigan Holstein-Friesian Association meets at East Lansing. H. W. Norton, Jr., Field Secretary.

Jan. 12-13—The thirtieth annual meeting of the Michigan Improved Live Stock Breeders' and Feeders' Association at East Lansing.

Jan. 24 to 29—Grain Show by the Wisconsin Agricultural Experiment Station, La Crosse. E. D. Holden, Ass't Secretary.

Feb. 1-4—Manitoba Dairy Association will meet at Fort Garry Hotel, Winnipeg. Secretary, L. A. Gibson, Winnipeg.

Feb. 1-10—Mid-Winter Farmers' Course, Madison.

Feb. 1-10—Wisconsin Live Stock Breeders' Association, Madison. Geo. W. Davis, Secretary, Madison.

Feb. 4 & 5—State Live Stock Judging Tournament (roundup), Madison.

Feb. 15-17. Michigan Allied Dairy Association, Grand Rapids. Secretary, H. D. Wendt, Lansing.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, DEC. 27—The proposed official invitation of the International Dairy Congress to hold its sessions in the United States in 1922, was brought before the Senate on December 23, by a communication from President Wilson, transmitting to the Senate the letter of the Secretary of Agriculture, and the accompanying suggested form of action for giving congressional endorsement to the project. The letter of the President reads as follows:

"I transmit herewith a report by the Acting Secretary of State with an accompanying copy of a letter from the Secretary of Agriculture favoring legislation by the Congress that will give governmental sanction to the World's Dairy Congress, which it is contemplated to hold in the United States in 1922, and will enable the government of the United States officially to invite participation of foreign governments therein.

"I invite the attention of the Congress to the commercial and scientific value which the Secretary of Agriculture thinks will accrue to the important dairy industry of the United States by holding the proposed congress and I ask for the matter the favorable consideration of the Congress.

"It will be observed that no appropriation is asked for at this time but that if the holding of the proposed congress be authorized by the Congress of the United States, it may be that the dairy organizations of the United States may, if found necessary, ask the Congress for a small appropriation in addition to the $100,000 which they themselves propose to raise."

This letter indicates something of the time and effort that has already been put on this project by the committee named at the Dairy Show, of which B. H. Rawl, chief of the U. S. Dairy Division, is the active head. The whole matter had to be thoroughly investigated by the State Department, as it involves official invitations to many foreign nations, and then the inter-departmental arrangement had to be perfected whereby the Secretary of Agriculture and the Acting Secretary of State united in preparing the documents for the attention of the President who transmitted them to Congress. The only question in the way of prompt action is the possibility of appropriations next year. In the present state of the treasury every committee is watching carefully against expenses. It is thought that the way this has been safeguarded will preclude serious opposition on this ground.

⚜

A careful compilation of import figures shows that the first nine months of the year saw a total import of crude oriental oils into the United States amounting to approximately 310 million gallons, and raw material for pressing which would yield in round numbers 150 million gallons more. It is not possible to trace this material into domestic commerce at this time, but it is safe to assume that a large percentage of it is going on the tables of American consumers in the shape of imitation butter. This is the statement of facts back of the inclusion of oriental oils in the emergency tariff bill. Yet butter is omitted from the bill.

⚜

The emergency tariff bill, which was held up in the Senate by objections made by Senator Harrison of Mississippi, was read and referred on Monday, December 27, to the Finance Committee. The bill had a record breaking experience in the House; one day's consideration in committee, introduction in the House, one day's debate in the House, and passage by an overwhelming vote. It is probable that no other tariff bill of equal importance was ever passed so fast. All efforts to get dairy products included failed, and all efforts are now being bent to getting such an amendment in the Senate. The bill as it went to the Senate Finance Committee on Monday includes fourteen items: wheat, flour, onions, corn, potatoes, rice, beans, oranges, cattle, sheep, mutton, wool, peanuts, and oriental oils. Senator Gay of Louisiana has already given notice that he proposes to add a sugar amendment. Telegrams are pouring in on Senator McCumber of the Senate Finance Committee, and various other senators, demanding the inclusion of dairy products.

⚜

Some opposition is developing in the committee against the $30,000 appropriation for barns at the Dairy Division experiment station at Beltsville, Md. Chairman Anderson of the sub-committee seems to think that the high cost of building materials is a reason for postponing the work. The bill calls for most of the work to be done by the regular force at the station, the money being chiefly for materials. The possible saving by waiting for several years for lower prices would not possibly be more than a few thousand dollars.

⚜

The minister from Argentina has filed a protest against the proposed emergency tariff bill, and intimates that retaliatory tariffs will be instituted if Argentine butter, cheese, meats, and cereals are shut out. This illustrates another angle of the tariff tangle.

⚜

Guests of the "Hired Men's Club" the past week included Aaron Sapiro of San Francisco; J. R. Howard, president A. F. B. F.; E. E. Chapman, former National Lecturer of the National Grange; Professor Bristow Adams of Cornell University; and Harlan Smith, Director of Information, and R. T. Cobb, director of Press Service of the Department of Agriculture. "The Hired Men's Club" is the informal organization of agricultural news writers' and farmers' organization representatives.

⚜

As this is written, the bill reviving the War Finance Corporation is still unsigned and in the hands of the President. Opinions differ widely as to its avail in the present emergency. The Capper—Volstead Collective Marketing Bill is in conference, with farm organization leaders making a determined fight to eliminate the Senate amendments. Aaron Sapiro, the California attorney who is representing the California co-operative associations, has stated publicly that he would prefer to have no legislation at all, rather than accept the mutilated Volstead bill as the Senate amended it.

Ridgway Goes With Creamery

Professor J. W. Ridgway, for ten years head of the Dairy Department of the Texas Agricultural College, and recently county agent of Cooke County, Texas, has accepted a position as head of the dairy development work for the Misteltoe creameries of Texas. His work will be dairy extension work among bankers and business men in communities where dairying can be safely developed so that creameries and other marketing projects may come in later.

Brown Swiss Dispersal Sale

The Brown Swiss herd of J. C. Moore of Illinois was recently dispersed. Twenty-one head averaged $247. The high priced animals of the sale were Ramona M. and Olga, purchased by Ferd. Krumpe of Illinois for $400 each. The only other animals to exceed $300 were Helen Mc., purchased by Carl Bormet, Illinois, for $305, and Luvois, purchased by Ralph Sands, Illinois, for the same price.

This Wonderful Harness Sent On 30 Days Trial FREE

See how rings wear end of straps

Let me send you this wonderful no-buckle harness at my own expense. Look at it. Examine it. Compare it with old style harness. Put it on your team and use it for a month at my risk. Give it any and every test you can think of. If you are not convinced that it is the handsomest, the strongest and best harness you ever saw or tried, pack it up and send it back. I'll pay the freight.

No Patching—No Mending—No Repair Bills

Buckles cut harness straps. Buckle-tongues tear them. Rings and dees soon wear straps in two. Examine your own harness and verify this. You'll find more than 100 places where buckles, rings and dees are wearing it; places where you'll soon have to repair it. Walsh Harness will save you that trouble and expense.

See How Buckles Cut and Tear Straps

Walsh Harness

No Buckles
No Rings
No Loops
No Holes in Straps
No Billets
No Friction

Adjustable to fit any size work horse

Lasts a Lifetime

Walsh Harness has 864 points of improvement over old style harness. Besides having no buckles, no rings, no dees to wear it out, it has no loops or billets to waste leather or catch the lines—no snaps to break, no holes to weaken the straps. A built-in hame fastener does away with hame straps. A proven success—in actual operation on farms in forty states.

Costs Less than Other Harness

2-21

The price of the Walsh is as low as any harness of the same grade materials — no more. Yet it outwears two sets of the best old style harness and saves you the cost of repair. It costs less therefore, in the long run, than any other harness you can buy. Try the Walsh at my risk for 30 days FREE. See for yourself what a wonderful harness it is and you'll never waste another dollar on old style harness as long as you live.

When Writing to Advertisers, Mention Hoard's Dairyman

New York Federation of Agriculture

H. H. LYON, NEW YORK

THE New York Federation of Agriculture was organized for the purpose of assisting agriculture, especially in the lines of sales and transportation. Farmers, said Mr. Bradley, the president of the federation, think for themselves and they know much. It is unreasonable for outsiders to tell the farmer what to do, or to decide what those outsiders can or should do for him. It might be well to mention the fact that there are really five thousand members of the federation, but only a small proportion was present at the Rochester meeting in December.

Dr. Warren of the state college was introduced as the best equipped man in the United States to discuss economic questions of agriculture.

"The reasons for the present bad conditions in farming are several," said Professor Warren. Among these are the weather the past season, a demoralized world, and too rapid deflation. While we have not a dense population in the sense that China has, yet we have no longer a thinly populated country. Old rough and ready methods are becoming a little out of date. While we do not like to burn foods and should not destroy them, it is better to burn them for fuel than to rot. In years of large crops they should be stored against years of shortage, and this ought to be done by the farmers. There is no real surplus of farm productions. The trouble is unequitable distribution. Dairymen are suffering because there is no market for milk, the markets being blocked by stores of condensed. European children are starving for want of this milk. We need to look ahead further. There is always need for all we produce in the course of four or five years, and usually in two years. Grains can be held on farms. Put cotton and wool in store houses and farmers can hold them by means of co-operation.

The wool problem in New York is a vital one. Not that we are so largely engaged in producing it but those who do grow wool are now hard hit. A tariff of 10 to 12 cents a pound on imported wool will be right, says E. L. Moody, president of state association. The plan to embargo wool until tariff becomes effective is something that needs doing right now.

It is found that the South favors tariff on wool, for wool is coming to be so cheap that it competes with cotton. To go further, it is found that the South wants tariff on oils that compete with cottonseed oil.

The resolutions started off with a statement that country children should have just as good educational advantages as any children of the state. Also that the patrons of country schools are as fully entitled to control their local affairs as those in congested city districts.

A second resolution called attention to the profits of railroads irrespective of efficient management and urged that this is not consistent. Others should have the same advantages if the railroads have them.

Speaking of the shortage of refrigerator cars, the association called for the building of 20,000 cars equal at least to the standard of the U. S. R. R. Standard refrigerator car. All cars over ten years old rebuilt to meet the standard.

The federation opposes all daylight saving laws, and favors terminal markets and wholesale sale of all farm products.

The costs of production and distribution of farm products should be taught in all schools, and charts and figures furnished for the pupils to take home.

The killing of rabbits that are doing damage should be permitted, says one resolution, having particular reference to the orchards.

The federation urges that the federal government facilitate the export of dairy products for the protection of starving Europe and the relief of our home dairy industry.

The meeting favored strongly the bonding of all milk dealers. They also wish to combat discrimination in freight rates. Still another point made was that co-operative banking should be authorized by Congress, and permission given co-operative associations to use capital and make profits.

Some of the problems of agriculture were discussed by Professor Ladd of North Dakota. American agriculture is facing the most serious difficulties ever known, was the first statement. To begin with, he mentioned that bread selling at one dollar returns the producer of the wheat four cents. Cotton batting selling at 46 cents brings the producer of the cotton ¾ of a cent. Cloth at 28 cents brings the cotton producer .1 of a cent. It would take all the wool, now sold at 20 cents a pound, that two men can carry to pay for one suit of good clothes, while four or five men would be required to carry enough hides to pay for a high class of shoes, and each hide would make ten or twelve pairs of shoes. Our problem now, observes Dr. Ladd, is not increased production, or decreased cost of production, but better conditions of distribution. Corn is below the pre-war price while pig iron is 300 per cent above. Farm machinery is being listed for 1921 higher than last year. They have high machinery, high labor, and low wheat. The farmer gets one dollar or $1.50 for wheat. Yet he mentions that there is a real shortage of wheat in the country. To remedy bad conditions we need fewer organizations and better organizations. He regards the farm bureau as the best organization that we have. The farmer has reduced costs to the lowest point and he is poorer paid than any mechanic or laboring man.

In North Dakota the farmers have been driven to the point where they had to do something. They asked for relief by proper legislation, but got nothing, yet they constitute 77 per cent of the population of the state. The next thing was to go at it and elect their own lawmakers and executives. This was some two years ago. For twenty-five years they had been ground down by the oppression of speculators aided by the railroads, the banks, and the government. There was no law of supply and demand. In two years there has been much relief obtained. It has become possible to secure farmer owned elevators. A better system of grading wheat has been introduced and the dockage which was lost to the farmer before is now returned to him or paid for. It is now expected to erect terminals and enter the export trade. To come into the organization farmers must sign up for five years, must sell all they have to the association, and in case of failure to do so they forfeit twenty-five cents a bushel on all they sell outside.

Reports that have come to us indicate that the farmers of North Dakota have done something for themselves, but we also get statements that what they have gained by their

efforts has been offset by increased taxes. Dr. Ladd explained the tax question. For example, an unoccupied farm, owned by a townsman who lets it grow up to weeds, is taxed just the same as the neighboring farm which is farmed and made to produce good crops. This piece pays increased taxes. In other cases a home is exempted to the extent of a thousand dollars to encourage home-owning. It is rather an adjustment of taxes than an elevation of them. The Standard Oil has vast properties in the state where by shrewd management they were able to evade taxation. Laws were changed and now that concern pays taxes like other people. Their taxes have been increased.

I tried to study the federation to see if it is overlapping other associations. The more I see of it the more I am impressed with its usefulness. It does seem as though we are having many organizations, but possibly some of them have been too much social and not enough of the sort that is undertaken by the federation. It would be fine if all these organizations could come more closely in touch with each other and work in unison. More definite work might perhaps be accomplished.

Testing Records Give $265 Cow $1,000 Value

HOARD'S DAIRYMAN:—About six months ago J. D. Wilkerson bought Lady Korndyke Norma Pietertje from a small breeder in a neighboring county for $265. She was just an ordinary pure-bred Holstein cow. She is a large cow of fairly good type, it is true, but that is probably all she was worth as an untested cow. Certainly there was nothing about her to indicate that she would ever be a candidate for a state record.

But right here comes the difference between Mr. Wilkerson and the man who sold him the cow. Mr. Wilkerson is a man who doesn't like to be caught guessing where he is. He wants to know what is going on and where his profits are coming from. For that reason he has been a persistent booster for the Webster County, Missouri, Cow Testing Association and as soon as this association shows him a cow that isn't a money maker he promptly sends for the butcher. When "Lady" freshened she went on test along with the rest of the Wilkerson herd.

Then things began to happen. The first month she led all cow testing association cows in the state with almost 80 pounds of fat. The second month wasn't quite so good, but the third month she came back with better than 80 pounds of fat. She has been on test five months now and has twice broken the state record for monthly fat production. She has already produced over 500 pounds of butter in five months and her fifth month is her highest so far. With proper care from now on she should make 1,000 pounds of butter this year and will easily break the Missouri state record in the cow testing association class.

LADY KORNDYKE NORMA PIETERTJE WITH HER OWNER, J. D. WILKERSON, MISSOURI

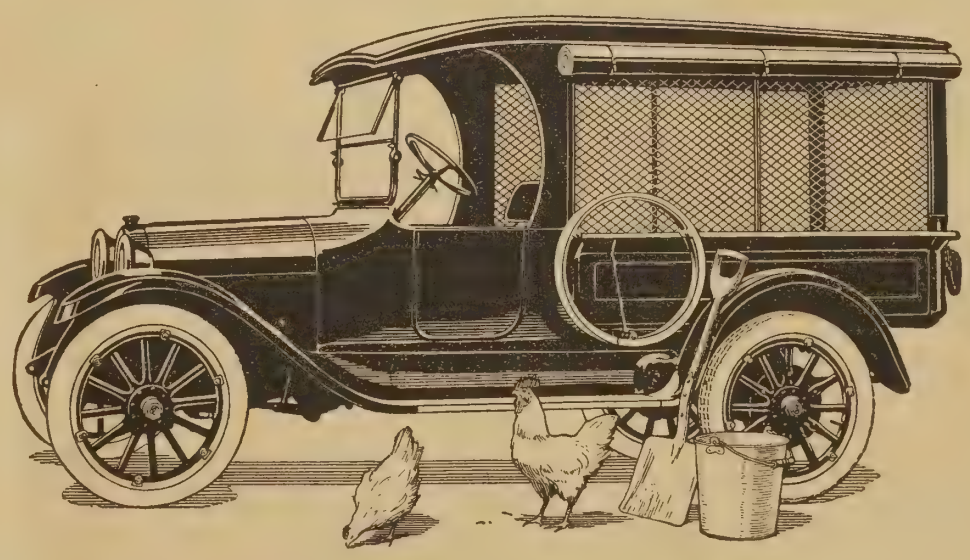
A cow testing association record increased her sale price from $265 to $1,000.

But "Lady" has done more than that for Wilkerson. She put him on the map among Missouri Holstein breeders. More than one breeder of Holsteins has come to me in the past few months and asked about "that Wilkerson cow". At those times I am mighty glad to be able to say that I have seen her in action on the Wilkerson farm.

She is not the best type of cow to be found and, as was said before, is not a cow that one would pick for a record producer. But if you could see her fill that big milk pail and then do it again at the same milking, you would change your mind. She is certainly a wonderful producer. And there isn't any very evident reason for it, either. The Wilkerson farm is very little different from other Ozark farms and the Wilkerson barn isn't much different from other Southwest Missouri farms. There is, however, one difference—"Lady" is a real cow and her owner is a real "cow man".

The record this cow was making was noised around until Wilkerson began getting offers for her. He turned all of these down till finally one of his neighbors tempted him just a little too much the other day and he sold her for $1,000. There was nothing about her to mark her as a superior dairy animal. There was only one difference between this cow and hundreds of thousands of other good cows. She was given a chance to prove her worth, and, proving it, made her owner $735 plus a splendid pure-bred bull calf and the profit on her production for five months.

Missouri. E. M. HARMON.



DODGE BROTHERS
BUSINESS CAR

In point of size, weight, capacity, low cost of haulage and long life, Dodge Brothers Business Car is certainly ideal for farm use

Naturally, these qualities have helped to give Dodge Brothers Business Car a wide reputation for reliability and good value

What the first Dodge Brothers owner you meet says to you about his satisfaction with his Business Car, is what Dodge Brothers owners anywhere and everywhere will say

Farmers Ask Credit Relief

President J. R. Howard of the American Farm Bureau Federation has just returned from Washington where he has been working in behalf of speedy and definite relief for the agricultural credits situation. Mr. Howard and Gray Silver, the Federation's Washington representative, appeared before the joint committee of agriculture and of banking and currency of the United States Senate and advocated measures embodying five definite planks in the American Farm Bureau Federation's immediate relief program.

(1) Regulatory power over farmers' co-operative marketing associations should be in the hands of the United States Department of Agriculture rather than the Federal Trade Commission.

(2) The farmers' co-operative marketing movement must not be hindered by the provisions of the Sherman law, enacted to control trusts and not with any intent to curb co-operation for the benefit of the public at large.

(3) The Federal Reserve Bank Act should be amended so as to provide preferential rates for loans for productive purposes over loans for speculative purposes.

(4) The Warehousing Act should be extended so as to serve the needs of both individuals and co-operative associations, and there should be based upon it a rural credits plan which will enable the farmer, individually or collectively, to market his crops in an orderly fashion.

(5) The Federal Land Bank System should be extended to provide farmers with personal credit, for such purposes as buying improved seed, live stock, machinery and equipment, on the same general plan as real estate loans are now provided.

According to Mr. Howard, these planks form the basis of a platform which he hopes to see forthwith erected by Congress for the benefit and encouragement of the farmers of America, just now heartsick to find that after producing bumper crops with which to feed the world, they are offered prices far below the actual costs of production.

Senator George P. McLean, chairman of the senate committee on banking and currency, presided over the joint committee hearing. The entire farmers' marketing program was discussed. It was agreed that a more direct marketing system must be had. The Capper-Volstead Bill, now in conference, was the particular legislation under consideration. Concerning the farmers' hope in this bill Mr. Howard said:

"The Capper-Volstead bill passed the Senate with two amendments which virtually nullify the intent of the act. The American Farm Bureau Federation is working with the conferees with the hope of having the amendments reconsidered and cancelled.

"The first amendment to which we object puts the regulatory power over co-operative associations in the hands of the Federal Trade Commission rather than the Department of Agriculture. We take the ground that the Federal Trade Commission is an investigational organization, while the Department of Agriculture is a welfare organization. It would be better for all concerned that the distribution of food supplies be under the supervision of the Department of Agriculture.

"The second amendment virtually nullified the whole Capper-Volstead Bill by putting back under the Sherman Act the whole co-operative movement. This amendment must be eliminated if farmers are to benefit by the legislation.

"We also took up rural credits needs and demanded on behalf of the farmers' amendments to the Federal Reserve bank law giving the board power to classify loans and separate loans for productive purposes from loans for speculative purposes. Loans for productive purposes are entitled to preferential rates.

"We ask that the Warehousing Act be extended so as to serve both individual and co-operative needs. We suggested that a rural credits plan be based upon this act which would enable farmers individually or collectively to market their crops in an orderly fashion.

"We hope to see an extension of the Federal Land Bank System so as to provide for personal credit on the same general plan as real estate loans are now provided. Personal loans would be for such purposes as will increase the farmers' productive capital along the lines of enabling him to build silos, drain his land, buy improved live stock and better seed, and in any way increase the efficiency of his farm as a producing plant. These loans, of course, would not run for so long as real estate loans, and would bear a higher rate of interest."

As a result of last week's Washington conference bills will be drafted immediately designed to furnish legislation as outlined.—American Farm Bureau Federation.

Freight Rates on Hay Reduced

HOARD'S DAIRYMAN:—Dairymen and feeders of live stock located far from the important producing sections have been exercising unusual caution in the purchase of alfalfa hay in recent months. The price has been too high compared with the returns from dairy products and from beef cattle and hogs and sheep, and relatively far out of line with other commodities used in feeding and dairying operations. In fact, this disparity still exists, but the prospects for prices for alfalfa hay indicate that the readjustment will be carried downward to a sufficient extent to warrant a friendlier attitude toward the "wonder plant" on the part of the consuming trade.

Basis for the bearishness which pervades the market for alfalfa lies in the recent voluntary action by carriers in placing into effect an emergency rate equal to 50 per cent of the recent tariff from the important producing sections of the Northwest, particularly in Idaho, to Missouri River points, including Kansas City and Omaha. The new rates became effective December 24, the average rate on alfalfa hay to Kansas City from Idaho now being around $10 a ton compared with $15 a short time ago. Even before the emergency tariffs were filed, shippers of alfalfa hay in the Northwest made preparations on a large scale for the sale of their surplus production on the basis of the new rates. Heretofore, the growers of alfalfa in the irrigated districts of the Northwest had been unable to move their surplus harvests because of the abnormal freight rate. At the same time the prices at distributing points in the Middle West, including Kansas City, the largest hay market in the country, have been maintained on an abnormal level because hay could not be drawn from distant and important producing sections. The difficulty, of course, is not entirely eliminated, for the emergency reduction includes only the Northwestern territory, where the growers have been unable to "cash in" on their surplus cuttings.

But the action of the carriers is looked upon as a precedent by the trade, and the districts not already granted reductions are now making

an effort to effect a general change. Not alone the producing sections, but the districts which bring in large quantities of hay for feeding also are agitating for a lower tariff. So far as the emergency exists, the consuming sections deserve the same if not greater consideration than the Northwest. The present exorbitant freight rates to consuming territories are responsible to a far greater extent for the partial demoralization of the forage industry than any other factor, the extremely light demand for hay now being due largely to the high delivered costs to the buyer. Hay prices at the distributing points in the Middle West already are abnormally low, at least considerably under the cost of production, but by the time the hay reaches the ultimate consumer in the East, in the Southeast and other important buying outlets, the price is close to the highest on record. The carriers now are receiving a greater portion of the price paid for hay on the largest markets than the producer receives. If a reduction in the freight rates from the distributing points to the consuming sections is granted, the rates from the producing districts will take care of themselves. And the producer will doubtless benefit by the strengthened position of the market.

Alfalfa prices are expected to decline further. Among the close observers of the market, the prediction is freely made that prices must recede to a basis around $20 a ton for the best grades of shipping alfalfa in Kansas City, if not less, which means that the market must decline further about $5 a ton. In view of the fact that Idaho and other Northwestern hay is of good quality on the whole, it is only reasonable to anticipate that the better grades, which dairymen almost generally demand, will suffer a sharper revision of prices than the cheaper offerings, which already are low, selling down to $12 a ton in Kansas City. Terminals already are receiving more than sufficient hay to meet the requirements of the consuming trade. This is indicated by the fact that on the recent moderate movement rather sharp declines have occurred. During the late fall and early winter of the last few years Middle West markets received enormous quantities of alfalfa from the Pacific Northwestern irrigated producing territory, Kansas City alone getting an aggregate of more than 1,000 cars weekly.

Prospects for improvement in the demand situation are not encouraging. It is probable, of course, that the colder weather may stimulate buying of hay by sections which have depended largely on wheat pastures and local supplies of rough feeds in recent weeks. But the stocks of feeds as a whole are too great in the country to permit of sharp improvement in the demand, and feeders will not show a preference for alfalfa hay when other commodities can be substituted at a cheaper price. While some producers consider the market for alfalfa too low even on the present basis and some are actually refusing to dispose of their surplus cuttings in the hope of forcing a rebound, they doubtless have overlooked the fact that alfalfa is selling at an actual premium over corn ton for ton and is even higher than cottonseed cake and meal with a protein content of 43 per cent in some important producing channels. It is rather ridiculous, for example, for the producer of corn in Iowa to sell his coarse grain at less than a cent a pound net and then be forced to pay about a cent and a half a pound for alfalfa. The consuming trade realizes the relative position of alfalfa, and this is one of the strong influences limiting demand on markets. On this basis, it is hardly reasonable to anticipate firmer prices for alfalfa.

Missouri. SANDERS SOSLAND.

New York Butter Market

NEW YORK CITY, DECEMBER 28:—Danish butter continues to arrive in fairly large quantities. During the past week 874,160 pounds were received in this market. In addition, about 500 casks of Holland butter were unloaded. The Holland butter was a disappointment to its handlers as its quality was rather inferior. At the present time, aside from the fact that it is preventing prompt sale of good firsts, the Danish butter is having little effect on the market. There is a scarcity of fancy domestic butter and the Danish butter is supplying a want. Undoubtedly, the prices of high grade butter would mount considerably but for the Danish butter, but it is, without doubt, better that prices should go no higher. There is keen activity at present which would be materially reduced in case prices were higher. Then, too, high prices would cause a demoralization of the market later when the natural fall in prices materialized, as the slump would be very great. As it is, receivers in general are predicting a sharp decline in prices with the approach of spring.

The buyer continues to demand strictly fancy butter. However, there is a growing demand for butter of medium quality and the price of it has advanced faster than that of extras and higher scoring butter. While fancy butter has advanced but ½c during the week, good firsts have advanced 1c. That is an encouraging sign for receivers who are holding large quantities of firsts. There seems to be little to encourage those who hold large quantities of seconds. Buyers even refuse to make bids on lots of such butter as they state that there is no demand for it. Centralized butter is moving very slowly and at prices ridiculously low. Some receivers who speculated heavily in centralized butter find themselves facing enormous losses. There is no movement of the Argentine butter, which arrived some months ago, and it is doubtful that it will be absorbed at all, unless there should be a prolonged strike period.

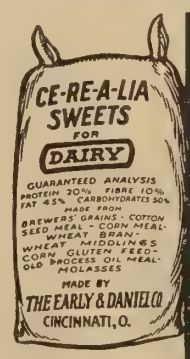
On Monday of last week, extras were quoted at 55@55½c. On the following day, because of the increased activity just previous to the Christmas holiday, the price advanced ½c. Since that time, while there has been active trading, there has been no further change in quotations on fancy butter. Firsts, however, advanced ½c today. Held butter is in firmer demand and has advanced in price, high scoring June make selling at 51@52½c. Danish casks are quoted at 51@53c. On the whole, the market can be said to be firm and active on all classes of butter except seconds with quotations as follows: Extras (92 score), 56c; higher scoring than extras (93 score or higher), 56½@57c; firsts (90—91 score), 48@55c; firsts (88—89 score), 43½@47c; and seconds (83—87 score), 37@42c.

W. B. LIVERANCE.

New Jersey Record Broken

Jolly Little Lady, a Jersey cow owned by F. F. Dryden of New Jersey, has completed a record of 10,614 lbs. of milk, 605 lbs. of fat, exceeding her Register of Merit requirement by 139 per cent. This makes her state title holder for junior two-year-olds, her record being begun at the age of two years, 25 days. She displaces Sophie's Tormentor Elvira, whose record is 9,535 lbs. of milk, 525 lbs. of fat.

These Wrappers Advertise Your Butter



YOUR butter wrappers are your own *paid* advertising space! Use them. Make them pay a profit. Use Paterson Vegetable Parchment wrappers because they not only preserve butter but make your package attractive to the butter buyer.

The sanitary, clean appearance of butter in these wrappers is a mighty factor in the final choice of the fastidious customer.

If you buy Paterson Parchment Paper Wrappers in lots of 5000 or more, we will print your advertisement on them in attractive display and positively guarantee the printing will not stain the butter.

Make Every Cow Make Money

Here's how to make your dairy pay. Keep only good cows and feed only good feed—CE-RE-A-LIA SWEETS.

Ce-re-a-lia makes more milk 49 cases out of 50 and the 50th "case" is very likely a "sleeper." Sell her and buy more CE-RE-A-LIA SWEETS for the other 49. Try Ce-re-a-lia on our famous money-back offer:

Feed One Cow Four Weeks at Our Risk. If she does not give more milk or more butter fat at less cost you get your money back. Write for details.

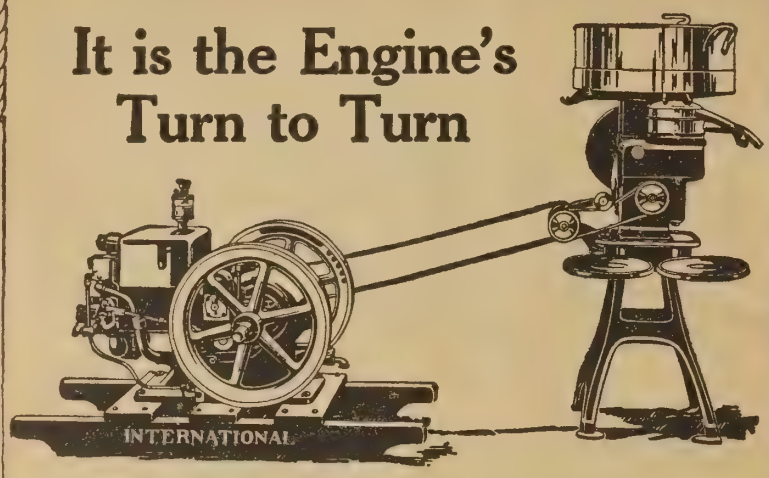
THE EARLY & DANIEL CO.
301 Carew Bldg., Cinn., O.

Ce-re-a-lia Sweets

All feed, No filler of any kind.

Big Special Offer—Write Us At Once

We are Making a great big Special Offer to Farmers on our Oil Burning Tank Heaters



This is your opportunity to get a CLOVER LEAF Tank Heater under conditions that are unusual—

The short season finds us with a small stock on hand and rather than carry them over we are going to make a proposition that NO Farmer can afford to overlook—

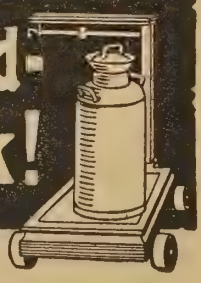
Write us about this and we will give you full details. You cannot afford to have your milk and dairy cattle drinking ice water—causing a loss of profit—not when you can get such a special offer as we want to make you—Direct. Let us tell you about it—Write us at once.

Cedar Rapids Foundry & Machine Co. Cedar Rapids, Iowa

It is the Engine's Turn to Turn

EVERY dairy farmer who handles a large volume of milk knows that turning the easiest running cream separator in the world by hand gets to be monotonous work before the day's run is finished.

The **Primrose Direct Power Drive** has simplified greatly the matter of separation on a considerable scale. This practical little addition to Primrose efficiency can be attached to any hand-operated **Primrose Cream Separator** and does not interfere in any way with hand turning of the separator.



By means of this simple attachment, direct connection can be secured with an engine without speed-reducing gear, to a line shaft or portable electric motor.

If your milk volume has reached such proportions as to make separating a real task, then it is most certainly the engine's turn to turn. A **1½ h.p. International Kerosene Engine** and **direct-power-drive Primrose** will shoulder the job and handle it efficiently.

INTERNATIONAL HARVESTER COMPANY

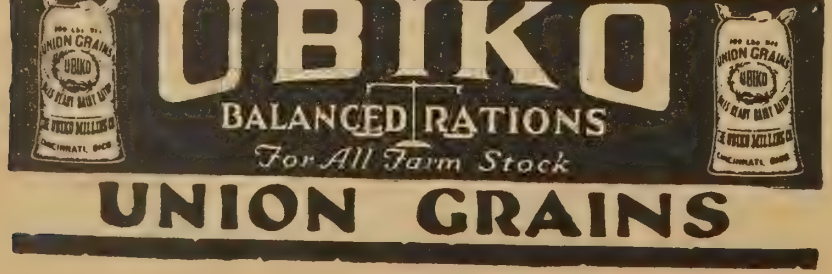
Weigh the Feed-Weigh the Milk!

UNION GRAINS was the first ready-mixed, balanced dairy ration ever offered—and it's always been known as the biggest producer that ever came out of a feed bag.



Big Dairies use it. The Hershey Chocolate Company's big herd of 2,000 cows have eaten it for years and the Hershey Company urges all the farmers whose milk it buys to use it. They want more milk. They want it produced as cheaply as possible. So they buy an average of four carloads of Union Grains every month. And they're the kind of people who know whether it pays or not!

Seventeen years of experience in mixing dairy feed goes into every bag. It's a work of real experts. You can't be sure that your own mixtures are the best you can do until you have tried Union Grains.

Write for a Union Grains Cost Sheet and know what dairy feed actually is costing you.

We also make Ubiko Stock Feed, Ubiko Pig Meal, Ubiko Buttermilk Egg Mash, Growing Mash, and Scratch Feed.

Association Notes

West Branch—Tri-County, Iowa:—The association began its second year on November 1st with 18 members owning 210 cows. During November butterfat sold for 65—68c per lb. and milk on a basis of $1.10 per lb. of butterfat contained. Bran retailed at $38 per ton; oil meal, $60; cottonseed meal, $50.

Weiser—Payette Co-operative, Idaho:—A car of feed was purchased co-operatively during the month of November. Glendale herd of registered Jerseys sold at Payette at good prices. Many purchased their first pure-bred dairy cattle. Market milk testing 3.4% sold for $3.85 per cwt. The creamery paid 60c per lb. for fat. Milk retails for 14c per quart, butter for 65c per lb., and cheese for 35c per lb. Feed prices are: Soy bean meal, $67 per ton; linseed meal, $89; molasses feed, $64; mill run, $43.

Bourbon County Co-operative, Kansas:—About six unprofitable cows were sold in November. One pure-bred bull has been purchased to be used in the pure-bred Holstein Association in this county. This is the second bull purchased since last spring. The two bulls will be used in the two units, about fifty cows in a unit. The county agent has ordered a carload of cottonseed meal to be distributed among the farmers and dairymen. They expect to ship in a car each month this winter. Four per cent milk sold for 27c per gallon. The condensery paid 65c per lb. for fat and the creamery paid 55—60c per lb. Milk retails for 14c per quart, butter for 50c per lb., and cheese for 40c per lb. Corn sells for 40c per bushel; oats, 40c; bran, $32 per ton; cottonseed meal, $40.

Du Page County, Illinois:—November market milk testing 3.5% sold for $3.05 per cwt. and 4c per point above. Milk retailed for 15c per quart and butter for 66c per lb. Feed prices are as follows: Alfalfa, $30 per ton; stover, $5; bundle corn, $10; silage, $8; barley, $40; oats, $40; bran, $35; oil meal, $68; gluten, $58; corn, $32; cottonseed meal, $51.

McHenry No. 1, Illinois:—During November, milk sold for $3.05 per cwt. for 3.5% test and 4c per point over. Prices of feeds were: Bran, $40 per ton; oats, $38; oil meal, $70; cottonseed meal, $60; corn and cob meal, $40; barley, $45; alfalfa, $35; clover, $32; silage, $8.

Barnesville Co-operative, Ohio:—Dairymen received $3.50 to $4 per cwt. for 3.5% milk during November, and 5c per point above this test. Feeds sold as follows: Larro, $3.25 per cwt.; oil meal, $3.50; bran, $2.25; cottonseed meal, $3.50; hominy, $2.75; beet pulp, $3.10; oats, $2.20; corn, $2.25.

Coshocton County, Ohio:—This organization in its first month's endeavor has been quite successful. From the 21 herds, totaling 175 cows, the high cow for November is a Jersey owned by J. L. Sicker, which produced 52.33 lbs. fat in 918 lbs. milk. Another Jersey from the same herd produced 52.18 lbs. fat in 1,065 lbs. milk.

Whitewater, Wisconsin:—Most of the cows in the association have increased their production over that of their last freshening, some of them as much as 40 per cent. This is due to better care and feeding. The November price for 3.5% market milk was $3.05 per cwt. and 4c per point above. The condensery paid 65c per lb. for fat. Milk retails for 14c per quart, butter for 60c per lb., and cheese for 27c. Prices paid for feed are: Bran, $38 per ton; oil meal, $66; corn, $22; oats, 48c per bushel.

Richfield, Wisconsin:—One member, Mr. A. A. Wiedmeyer, has proven to himself that it pays to test. After joining the association, he was encouraged to run a seven-day test, and without any preparation he made two 22-lb. butter records and one 18-lb. record. One of his Holstein cows, Johanna Pontiac Segis De Kol, made 22.5 lbs. butter and 544.6 lbs. milk 89 days after calving. In nine months she produced 13,950 lbs. milk containing 474 lbs. fat, losing the first month of her period before starting the association year. Her last calf sold for $225 in October at a sale where calves of the same age and an equally good type brought only $80 to $135. Mr. Philip Becker, another member, advocates keeping fewer cows, caring for them properly, and feeding them well. Six members are fitting for seven-day tests. Most of the dairymen are feeding balanced rations. Farmers are well supplied with corn and silage and most of them have their supply of

protein feeds on hand. Eleven head of pure-bred Holstein females were bought during October. The condensery paid $2.55 per cwt. for milk and 4c per point above or below. The cheese factory paid 65c per lb. for fat. Butter retails for 55c per lb. and cheese for 32c per lb. Prices for feeds are: Oats, 64c per bushel; barley, $1; corn, 70c; bran, $36 per ton; oil meal, $64; gluten, $52; middlings, $60.

Ellington, Wisconsin:—All members are feeding grain and most of them are using a balanced ration. Farmers are looking for lower feed prices so very little feed is stored for future use. In November the condensery paid $2.50 per cwt. for 4% milk. The creamery paid 62c per lb. for fat and the cheese factory paid 65c per lb. Feed prices are: Bran, $35.50; middlings, $35.50; oil meal, $60; gluten, $54; oats, 46c per bushel; corn 71c; barley, 90c.

Johnstown, Colorado:—The average for this association for the year 1918—1919 was 6,300 lbs. milk containing 250 lbs. fat, 214 cows completing the year. For the year 1919—1920, 312 cows finished the year and averaged 8,149 lbs. milk containing 316.2 lbs. fat. One herd in the association shows a 40% increase in butterfat in three years testing. This herd averaged 283 lbs. fat, with 10 cows, during 1917—18, 388 lbs. fat the next year with the same number of cows, and 396 lbs. fat during the year 1919—1920, with 20 cows. The November price for milk was 35c per gallon. The condensery paid 55c per lb. for fat and the creamery paid 65c per lb. Milk retails for 14c per quart. Feed prices are: Alfalfa, $10 per ton; silage, $6—$7; bran, $1.70 per cwt.; cottonseed meal, $3; linseed meal, $4; oats, $1.90; barley, $1.90; corn chop, $1.80.

Douglas County, Colorado:—Mr. W. G. Schubarth has had the high herd three months in succession and Mr. E. J. Lindquist has had the high cow four straight months. These cows are fed grain according to their individual production and the records show how well it pays. Two members have purchased 17 head of heifers, one has bought 15 high grade Holsteins, and another has bought two cows and a registered bull. Butterfat sold for 85—90c per lb. in Denver and for 75c per lb. at Castle Rock. November feed prices are: Alfalfa, $14—$16 per ton; silage, $8; bran, $1.80 to $2.50 per cwt.; cottonseed meal, $2.50—$4.50; linseed meal, $4—$5.50; oats, $1.65—$3; rolled barley, $3; corn chop, $1.80—$3.

Arkansas Valley, Colorado:—All members have silos but one. Six have two silos each. Every herd is headed by a pure-bred sire. Several breeders are preparing stock for the National Western Stock Show in January. November market milk testing 3.5% sold for $2.50 per cwt. Milk retails for 14c per quart. Feed prices are: Alfalfa, $10 per ton; silage, $5; beet pulp, $2 per cwt.; beet tops, 50c; bran, $1.35; cottonseed meal, $3; oats, $2; barley, $1.40; ground barley, $1.50; corn chop, $1.85; maize, $1.50; alfalfa meal, $1.50; shorts, $1.75; speltz, $1.25; cane hay, $6; fodder, $2.50.

Platte, Boulder, and St. Vrain Valleys, Colorado:—For three months the herd of W. A. Ewing & Son has had the highest average in the association. During November the condensery paid 55—85c per lb. for fat and the creamery paid 65c per lb. Feed prices are: Alfalfa, $8—$10 per ton; silage, $6; dry beet pulp, $31; bran, $1.85—$2.50 per cwt.; linseed meal, $4.50; cottonseed meal, $4; oats, $2—$2.50; barley, $2—$2.50; corn chop, $2—$2.40.

Logan County High School, Colorado:—This is an association of high school students who are keeping records on herds under the supervision of Mr. Sandhouse. They are doing fine work. They almost doubled the number of cows tested this month. Market milk sells for 32c per gallon and retails for 40c per gallon. Feed prices are: alfalfa, $8.50—$10 in stack; beet products, $3—$4 per acre; pulp, $2 per ton delivered; bran, $2 per cwt.; cottonseed meal, $50 per ton; oats, $2 per cwt.; barley, $1.75; corn chop, $1.50.

St. Louis County, Missouri:—Cooperative bull clubs are being organized in this county. One member of this association bought a bull from Wisconsin for a little less than $1,000. Due to her record, one average grade Jersey cow sold for $125. Three unprofitable cows were sold during November. Market milk testing 3.25% sold for $3.50—$3.90 per cwt. and 4—5c per point above. Milk retails for 12—20c per quart. Prices paid for feed are: Alfalfa, $38 per ton; clover, $30; mixed hay, $26; silage, $8—12; bran, $40; shorts, $44; ground barley, $60; Cow Chow $58; Shumacher, $58—$60; Big Q, $72; cottonseed meal, $56—$60; linseed meal, $70.

Canaan, Connecticut:—Twenty-two "boarder" cows were sold during November. One pure-bred bull was placed. Three per cent market milk sold for $3.74 per cwt. and 4c per point above this test. Bran sold for $48.50 per ton; gluten, $58.50; cottonseed meal, $58; mixed feed, $49; oil meal, $64; hay, $30; silage, $8.

Merrimac Valley and Strafford—Carroll, New Hampshire:—One new herd was taken on in November. Most of the members are buying their grain of the Farmers' Exchange. One herd had an auction to sell off surplus stock. Market milk sold for $4.59. The creamery paid 76c per lb. for fat. Milk retails for 15—18c per quart and butter for 75c per lb. Feed prices are: Bran, $45 per ton; gluten, $60; cottonseed meal, $65; oil meal, $65;

Shipping Farm Meat

Numerous inquiries have come to our office during the past year relative to the shipment of meat or meat products to points outside the state. These inquiries indicate a lack of knowledge on the part of those offering the product for interstate shipment, and also on the part of the express or depot agent whom the shipper feels should have an adequate knowledge pertaining to this subject.

We have numerous inquiries from people living close to state boundaries and contiguous to large cities or mining towns in adjoining states which afford them the best kind of a market for veal calves and other food animals slaughtered by farmers on the farm. There seems to obtain in the minds of people wishing to market their products in this manner the idea that some regulation covers this, but they do not know just what has to be done. As previously stated, frequently the express and depot agents are not posted, and in many instances show a lack of familiarity with the regulations and are as prone to place a misconstruction on them as they are to guide the shipper in the right direction. However, the regulations provide for the legal shipment of such products and do not make such action difficult for the shipper. In fact, the law is clear and specific.

The shipper simply furnishes a certificate in duplicate describing the meat or meat product offered for shipment and certifies that on this date it is sound, wholesome, and fit for human food. The certificate should be furnished the transportation company. The following is the regular form used in such cases. It comes under Section 8, Regulation 25, of B. A. I. Order 211.

"When cattle, sheep, swine, or goats have been slaughtered by a farmer on the farm, and any meat or meat product derived therefrom is offered to a carrier for transportation from one state or territory or the District of Columbia, or to or through another state or territory or the District of Columbia, or to any place under the jurisdiction of the United States, or to a foreign country, the carrier may so transport such meat or meat product which is identified as derived from any of such animals slaughtered by a farmer on the farm. The carrier shall require, and the shipper shall make and deliver to the carrier, a certificate in duplicate in the following form: 'I hereby certify that the following described uninspected meat or meat food products are from animals slaughtered by a farmer on the farm, and are offered for transportation in interstate or foreign commerce as exempted from inspection according to the act of Congress of June 30, 1906, and that at this date they are sound, healthful, wholesome, and fit for human food, and contain no preservative or coloring matter or other substance prohibited by the regulations of the Secretary of Agriculture governing meat inspection.

"The signature of the shipper or of his agent shall be written in full. This certificate shall be separate and apart from any waybill, bill of lading, or other form ordinarily used in the transportation of meat. The duplicate certificate shall be forwarded immediately by the initial carrier to the Chief of the Bureau of Animal Industry, Washington, D. C."

Any carcass slaughtered by a farmer on the farm, or meat products manufactured by a farmer on the farm, may be shipped interstate under this certificate. This does not apply to local butchers or those conducting slaughtering establishments.

We advise keeping this for future reference.

Oregon Dairy Council

HOARD'S DAIRYMAN:—Joseph E. Dunne, president of the Pacific Coast Ice Cream Manufacturers' Association, was elected president of the Oregon Dairy Council on December 15 at the annual election of officers of the council. P. O. Powell, a member of the Oregon state legislature, was elected vice-president. F. L. Shull, manager of the Globe Mills, was elected treasurer. The secretary, Edith Knight Hill, who has been with the council since its formation and who has had charge of all the educational work, tendered her resignation, saying she believed that a good foundation had been laid and that the council is ready to get on a firmer financial basis and branch out and for this reason a good, live man should be elected secretary-manager or fieldman. The secretary has had charge of the publicity work also and she stated that she hoped that when reorganization takes place she may still be able to help in this line. The board re-elected the secretary to serve until reorganization makes necessary a change in the personnel of the force.

Mr. Dunne appointed a committee on reorganization. Fred W. Merrill, formerly of Minnesota, gave an address on plans for reorganization. He stated that Professor Bouska of Chicago said that nowhere had he tested better butter and cheese than was shown at the Butter and Cheese Makers' convention in Portland and that Oregon has a great future as a dairy state.

The council gave a vote of thanks and appreciation to Professor P. M. Brandt, the retiring president, whose leadership has been a great inspiration to the council.

E. K. HILL, Sec.

New England Ayrshire Club Meeting

Sixty members of the New England Ayrshire Club met in annual session in Boston, December 7th. C. F. Riordan of Massachusetts was elected president of the club; R. M. Handy of Massachusetts was re-elected secretary and treasurer. Speakers on the afternoon program were A. L. Tryon, J. A. McLean, E. A. Hutchins, and J. G. Watson.

A Natco Silo

Costs a Little More— Lasts a LOT Longer

IT does cost more to build with everlasting Natco Hollow Tile than with materials that soon decay, but it's far cheaper in the long run. A Natco Silo will not rot, burn, burst or blow down. It has no hoops to tighten, needs no painting and seldom any repairs. You can pass a Natco Silo to your children practically as good as new. Or the farm will bring more should you wish to sell.

Farmers who figure costs closely are using Natco Hollow Tile for silos, dairy barns, hog houses, dwellings, etc. Our book "Natco on the Farm" describes and pictures many such uses. Send for it today — *no charge.* Ask your building supply dealer to quote you on Natco Hollow Tile.

National Fire Proofing Company
1048 Fulton Building
Pittsburgh, Pa.

23 Factories assure a wide and economical distribution

Foundation and bottom courses of a Natco Silo. Note the still air spaces and the steel reinforcing bands.

Reduce Dues One-third

Due to the large membership and the increase in our finance, the executive committee of the American Association Creamery Butter Manufacturers decided to cut the dues from 15c to 10c a thousand for the members, on condition that all members pay on the amount of butter manufactured. The amount of dues the members will pay will be based on the calendar year of 1920 at 10c per thousand.

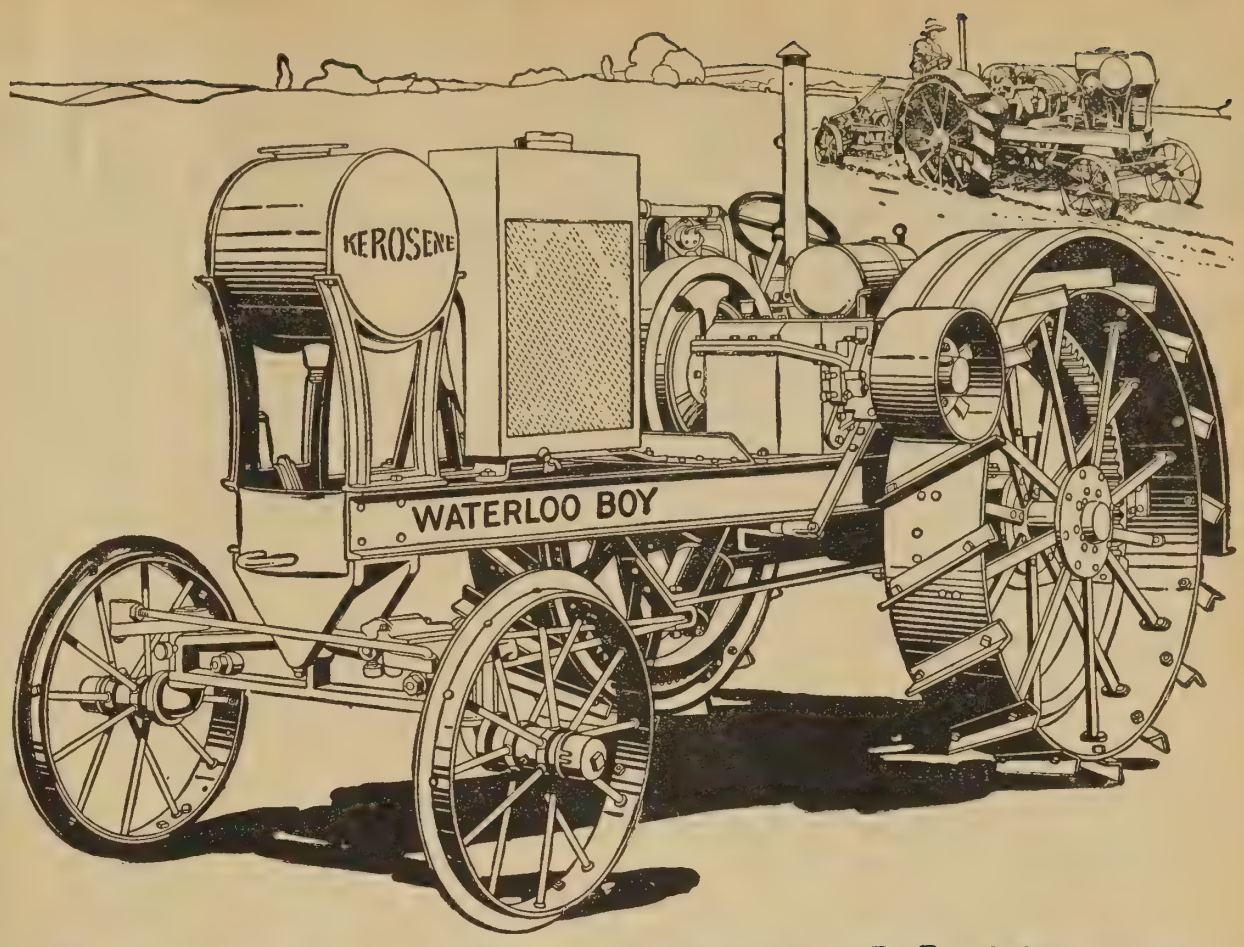
For the small fee of 10c a thousand, the members are entitled to one complete analysis of butter, chemically and bacteriologically, weekly. In addition to this, members who want to get their butter scored can have this done by sending in a pound weekly. This butter will be criticised and suggestions offered for improvement. This will accompany the analysis.

A weekly letter is sent to each member, giving a general review of market conditions. Also, a statistical letter is sent to each member, giving the increase or decrease in the make of butter. These statistics are based on the make of our members, who manufacture about 300 million pounds of butter annually, and cover a range of territory almost from the Atlantic to the Pacific, and extending from Canada to Alabama and Texas.

The American Association of Creamery Butter Manufacturers at the present time keeps two field experts, Professor F. W. Bouska and Professor J. W. Mitchell. Professor Bouska is well known to the creamerymen of the United States. Professor Mitchell is not as well known. He is a graduate of Queen's University at Kingston, Ontario, and was superintendent of the Kingston Dairy School for three years, leaving that position to take the chair of dairy husbandry at the Manitoba State Agricultural College, which he held for three years. He also had charge of dairy extension work in connection with his college position. Later he was professor of dairy husbandry in the maritime provinces, and had charge of dairy extension work. Professor Mitchell came to the association unusually highly recommended by Canadian authorities.

Where creameries are having trouble that cannot be adjusted by letter, they can get the service of Professor Bouska or Professor Mitchell by merely paying the railroad fare and hotel expenses while there. In the summer months, districts are mapped out and creameries in a certain territory will get the service of the expert, thus reducing the expense of railroad charges, as the creamery only pays the railroad expenses from the nearest point to their plant. The next creamery getting the service of the expert does likewise.

The dues paid, as stated above, are based on the make of the calendar year at 10c a thousand pounds of butter manufactured.



Any kind of a creamery is eligible to membership, whether centralized, individual, or co-operative. The smallest creamery is entitled to the same service as the largest creamery. Creameries making only 100 thousand pounds of butter annually are eligible to membership at $12 a year.

A resolution was passed at a meeting of the Executive Committee favoring an increase in tariff on butter and other dairy products.

G. L. McKAY, Sec.

Utah Dairy Course

Beginning January 17th, the Dairy Department of the Utah Agricultural College will give a two weeks' special butter and cheese course. A butter contest will be held Friday, January 21st. A cheese scoring contest will also be conducted.

9 Acres a Day for 42 Days

IN the big things and the little things that make for tractor efficiency, you can count on the Waterloo Boy. When the owner of a Waterloo Boy starts out in the morning he knows his tractor will do his work the way he wants it done, finishing the day as strong as when it started. And he knows his tractor will keep on doing the same thing, day after day, week after week, always responsive in meeting the requirements of economical work.

WATERLOO BOY
KEROSENE TRACTOR

This confidence in Waterloo Boy ability has been brought about by real field performance. For instance:

A farmer living near St. Thomas, N. Dakota, owns four Waterloo Boys. His name is Ray Huffman. Last fall his Waterloo Boys plowed 1,520 acres in forty-two days—nine acres per day for each tractor. And he was plowing seven inches deep. That meant dependable service, the kind that counts most.

Mr. Huffman's four Waterloo Boys burned 2,470 gallons of kerosene in plowing his 1,520 acres, or an average of only 1.6 gallons per acre—a remarkable showing, but not unusual for a Waterloo Boy. This is the sort of economical power that appeals to farmers who want their work done well at small cost.

Ask your John Deere dealer to drive out a Waterloo Boy. Watch how it handles your own drawbar and belt work on your farm, under your conditions. Drive it yourself. Then you will know why Waterloo Boy owners are satisfied with their power investment. Write to John Deere, Moline, Ill., for a booklet, describing the Waterloo Boy. Also ask for Better Farm Implements, a 114-page book giving description, care and operation of the full line of John Deere tools. It's free. Ask for package WB-414

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

A Story About Wheat

Of Interest to Teachers of Agriculture

Bread is such a common article of food found upon the tables of American families three times each day, that most of us, if closely questioned about the interesting wheat crop which makes our daily bread possible, would realize how little we all know about the thing which is of such vast importance to the human race.

The wheat plant has long been under cultivation, and it is quite evident that its origin even preceeds human history. To be sure the varieties which are being grown today are not the same as those which were grown through the past ages. In fact it would not be incorrect to say that the varieties of common wheats known today among the American and Canadian wheat growers are quite different from those grown by the Chinese 3,000 years before the birth of Christ. Environment and careful selection have been responsible for most of the changes that have been made. Evidently the ancient peoples of Egypt and Palestine grew wheat as a cultivated crop. Proof of this is to be found in the Bible, especially in the books of Job and Matthew. But, although a story telling about the history of this great crop would be very interesting, we shall have to leave that for another time, because our story is to deal with something quite different and perhaps more important.

The scientists who have studied wheat tell us that there are eight classes, some being of far greater importance than others. I doubt if any of the Juniors who read this story will be familiar with all of these classes. To the average boy and girl, wheat is just wheat and this is correctly so because all of our experiences have been with wheat as it is commonly grown on the farms. But, even so, there are large differences between varieties of common wheats that many of us do not know. For example, there are winter wheats and spring wheats, so named because they are either seeded in the fall or in the spring; and in either class there are numerous varieties. It would be folly for any one to attempt to learn all of the varieties in either group, but to know those which have always had an important place in wheat growing is quite another matter for Juniors who are interested in agriculture.

BREAD WHEATS
Left to right: Club, common (Turkey Red).

It will not be out of place to go back again to the eight classes of wheat and learn what they are. Perhaps the most primitive of these and nearest related to the wild ancestors of wheat is the one known as Einkorn. This is a German word meaning one grain, and if you were to examine a head of this wheat you would find that each little part that goes to make up the head contains only one grain and hence the name. Einkorn is a peculiar wheat because when it is threshed the kernels remain in the chaff and the heads merely break up. This is a wheat of little importance and it is found growing on the farms of some of the poorer European farmers. It is not used for flour at all, but is used by those who grow it as a feed for stock. No American farmer grows Einkorn.

Then there are two others something like Einkorn because they too do not thresh out of the chaff. They are Emmer and Spelt. Neither of these is used for flour but, like Einkorn, they are fed to stock in place of other grains like oats and barley. Both are grown to some extent among American farmers for this purpose. Emmer will withstand rather dry climates and also rust attacks and so it is somewhat popular in such regions, taking the place of oats as a feed for stock.

TYPICAL HEADS OF STANDARD COMMON WHEAT VARIETIES
Left to right: Turkey Red (winter), Bluestem (spring), Red Fife (spring), Marquis (spring), and Preston (spring).

Because these three wheats are quite a little alike, they are placed in one class, known as the Spelt group. It should be remembered that they are of little importance and they should never be confused with the more important wheats from which bread flours are obtained.

Then there is a second group made up of three others of the eight classes. These are known as the Durum group. Durum or Macaroni wheats as they are sometimes called are by far the most important ones of this group. This is a very interesting group. Durum wheats have quite compact heads and are very heavily awned or bearded. The kernels are very hard and glassy, some varieties being light colored, while others are red like the common wheats. Durum wheats do not make the best kind of flour for bread, because it is dark colored flour and very sticky. This is just the kind of flour for making macaroni and spaghetti and hence it is used largely for that purpose. Durum wheats are grown now to quite an extent in the eastern parts of the Dakotas where the common spring wheats do not do so well on account of the dry conditions existing there. This wheat will stand dry weather, in fact, it will make a good crop where the rainfall is as low as 11 to 18 inches a year. Its production has been on the increase ever since it was introduced for this reason. Kubanka is perhaps the most important variety being grown. As important as Durum wheat is, we must remember that it does not belong with the common wheat classes.

We said that there were three classes in this second group. Durum is the first and foremost one. The others are Polish and Polard wheats. The first of these doesn't look like wheat at all, but more like rye. The heads are large and chaffy and the plants grow very tall. It is of no value in this country and is but little grown anywhere excepting in the dry regions of wheat growing areas. The other class, Polard wheats, is grown to quite an extent in some of the European countries. France grows varieties of this class, and, like the common wheats with which we are somewhat familiar, they are used for bread flours. In fact there are varieties of Polard wheats that resemble the common wheats so much that they are hard to tell apart.

Six of the eight classes mentioned have now been accounted for. They are Einkorn, Emmer, Spelt, Durum, Polard, and Polish. There remains then but two others, and it should be stated right here that these two are very important in this country. In fact, Durum wheat is the only other one which has met the needs of certain American wheat growers.

If you were to go out to California about harvest time, you would find the wheat growers there growing wheats that look quite different from the ones we grow in other sections of the country. The heads would be rather short and very compact, even more so than Durum wheat. The straw of the plants is so very stiff that lodging so common in the other

DURUM GROUP OF WHEATS
Left to right: Durum, Polard, Polish.

wheats is scarcely known. The heads are either square or club shaped and for this reason these wheats are known as club wheats. The grains are usually very light colored, in fact so much so that they are called white. They are very starchy and soft and make a flour that has little stickiness. For this reason, the flour does not make the best bread, but is used in making crackers and pastries. Club wheats seem to be adapted only to this section of the country, and for those of us who do not live there, club wheats are quite as unknown as the others already referred to.

The last of the eight classes has to do with the wheats as they are commonly known to us. This whole class goes under the name of common or vulgare wheats, and it is here that the most valuable part of our story begins. One can travel for hours through Canada and the middle west of this country and see little growing in the fields but varieties of this class of wheats. It is from wheats of this class that the best flours are made. The thousand or more varieties belonging to this class are either winter or spring wheats. Did I say a thousand varieties? Well, do not be alarmed for not very many of these are valuable to our wheat growers. Winter wheats are always more valuable where the winters are not too severe, and, since we have some very hardy varieties, winter wheats are more important in this country than spring wheats; in fact, there are fully twice as many acres seeded to winter wheats in this country as spring wheats. What is known as the middle west produces the best flour wheats of the country. Here the climate is somewhat dry and usually

SPELT GROUP OF WHEATS
Left to right: Einkorn, Emmer, Spelt.

sunshiny at ripening time. This makes a hard wheat, the kind that is wanted for bread flours. Kansas, North Dakota, South Dakota, Nebraska, and Minnesota are by far the most important wheat states, and it is for this reason that the American people are always interested in the preliminary reports about the prospects for a big wheat crop in these states.

What should a junior know about these wheats? One thing to be sure, and that is the leading varieties of both hard winter and spring wheats. We learn about the leading breeds of cattle and hogs, so why should we not want to know about the leading varieties of the crops we grow? Any live boy or girl will agree with me that we should. And so we will try to give you some help that will make you a great deal wiser about this subject.

The leading hard winter wheat grown in this country is one called Turkey Red; not because the heads are red, but for the reason that the grains are reddish brown. The reason that this is such a valuable wheat is because it is very hardy and does not winter-kill very easily and because it is a splendid yielder, producing grain of excellent quality. Kansas wheat growers grow it or some kind that has been derived from it. The heads are always bearded or awned, smooth chaffed and quite short.

Turkey Red wheat has a very interesting history. It came to this country directly to Kansas in about 1870. At that time a colony of Russians, a religious sect known as Mennonites, settled in Kansas and they brought with them a few bushels of their best wheat. This happened to be Turkey Red and because the Kansas wheat growing conditions were so similar to those of that part of Russia from which they came, it did very well when planted here. And so this best of all hard winter wheats is not a native of this country, but a foreigner like the people who brought it to us and like them also it has been subjected to American civilization, until now we claim both as very useful citizens of America. But has American civilization changed the general appearance of this wheat? Not in the least, but it has improved it in some other ways. By carefully selecting from it, we have bred strains of Turkey Red that are better yielders and hardier, and although they go under different names, such as Kanred and Wisconsin Pedigree No. 2, they are still Turkey Red wheats of a little higher order. Although there are other hard winter wheats, you will be doing very well indeed if you learn to know this much about Turkey Red, the leader of all hard winter wheats.

And now we are ready to consider hard spring wheats, the ones that are grown in Minnesota, the two Dakotas, Nebraska, Montana, and Canada. In this section the winters are usually so severe that Turkey Red would kill out, so spring wheats are the rule, and we must look to the Canadians and thank them for many of the good things which we will say about spring wheats.

To simplify matters about hard spring wheat varieties, we will make three groups of them so any variety referred to will fall within one of the three. Undoubtedly what is known as Red Fife has been the leading variety of hard spring wheats up to within the last few years. This variety, together with others which have borne the same name, made up the Fife group. The greatest difficulty in spring wheat growing has always been a matter of getting varieties that would mature early so as to escape dry weather and rust, the two things which often ruin large areas of spring wheats. Red Fife met these demands better than other varieties and so it has always been popular. But it has not been without its faults. It is a beardless wheat, smooth chaffed, with medium long heads, and, like the Turkey Red, it, too, is a foreigner if we are to believe its historical record. There are two very good reasons for its name, red because its kernels are a reddish brown color and Fife after the man who introduced it into Canada.

David Fife, an Ontario farmer, introduced this wheat about eighty years ago. This is how it happened. A friend of Fife, living in Glasgow, Scotland, secured a small sample of wheat from a cargo of wheat in the harbor of Dantzig. Knowing that Fife was interested in wheats, he sent the sample to him. It was in the spring of the year when Fife received it, and not knowing whether it was spring or winter wheat, he took a chance and seeded it the same spring. But it proved to be a fall or winter wheat because it did not head out, excepting a few heads here and there. But David Fife did a sensible thing. He preserved the few heads that did ripen and the next spring he seeded the few grains he obtained and it is from this small amount that Red Fife wheat has sprung. The fact that the original sample came from a boat load of wheat in the harbor of Dantzig leads us to believe that Red Fife is also of Russian origin. Evidently the sample sent by his Glasgow friend was a mixture of spring and winter wheats. Such names as Glyndon's Fife and Power's Fife merely refer to improved strains of the original stock grown by David Fife. This wheat has always been prized for its excellent flour making qualities, but it has never met the demands of spring wheat growers because it does not mature early enough to guarantee against the ravages of dry weather and rust, and in parts of Canada against frosts.

What is known as the Bluestem group has also been of considerable importance to growers of hard spring wheats. This is also a beardless wheat, but instead of being smooth chaffed, it is downy or fuzzy. It, too, is somewhat late in maturing and so never has really filled the place demanded of these wheats. There was a time when Bluestem wheat was grown as a winter wheat in some of the mild sections of the east, but as it advanced westward it was developed into a spring sown grain. This variety may always be known from Red Fife and other spring varieties on account of its velvety chaff. Both Red Fife and Blue stem were the leading hard spring wheats being grown up to at least 1900. About this time plant breeders began to try to develop other varieties which would mature early. The Canadians were foremost in this and so we find a man by the name of Dr. William Saunders trying to develop new wheats by crossing two varieties. Red Fife was usually one of the wheats used in the crosses on account of its good qualities as a flour wheat. It was in this way that the third group of which we will now speak came into existence. This is the Preston group, but sometimes called the Velvet Chaff group. However, the first name is the preferable one for the wheats belonging to this group are not velvet chaffed at all but smooth and bearded, so to call them Velvet Chaff would be quite confusing.

Preston spring wheat is the result of a cross made betwen Red Fife and another hard spring wheat as the parents. The work was done under the direction of Dr. Saunders. This wheat was quite popular for a time, but it has never been considered the

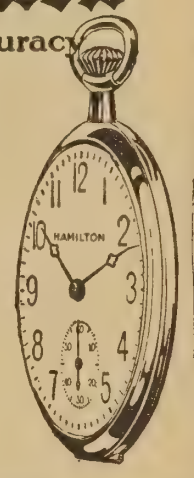
(Continued on page 1093)

What King Albert Learned from an American Engineer

King Albert of Belgium—in the cab window—drove the Twentieth Century Limited engine part of the way between Toledo and Elkhart.

Hamilton Watch
"The Watch of Railroad Accuracy"

As they approached Elkhart, Engineer J. A. Lux—in the gangway—pulled out his watch. His Majesty consulted his, and they compared time. After one look, "What watch do you carry?" asked King Albert. "A Hamilton," answered Lux. "Is it a good one?" inquired His Majesty. "Well, I've run trains by it for 25 years," said Engineer J. A. Lux.



Before leaving America, King Albert, through the State Department at Washington, bought a Hamilton.

Watches so accurate that engineers run the crack trains by them are watches that kings will buy.

There are many Hamilton models to choose from at your jeweler's. Prices range from $40 to $200. Movements alone, $22 (in Canada $27) and up.

Send for "The Timekeeper"—an interesting booklet about the manufacture and care of fine watches. The different Hamiltons are illustrated, and prices given.

Position wanted by experienced dairy hand, single, middle-age, strong, healthy, willing worker, no tobacco habits, etc. Reference furnished. Address BOX 539, care Hoard's Dairyman. 25-3

POSITIONS WANTED

Position wanted as farm manager. Single, agricultural college training, life time experience with live stock and crop production, up-to-date with farm implement and tractors, 10 years in managerial capacity, best of references. Address BOX 509, care Hoard's Dairyman. 22-8

Farm manager and graduate veterinarian with energy, push and proven ability, desires position on large, modern, certified milk or stock farm, where results will be appreciated. Fifteen years' experience with pure-bred stock and everything pertaining to the management of an up-to-date farm and dairy. Breeding for results a specialty. No proposition too large. Married, age 36 years. Best of reference. Address BOX 537, care Hoard's Dairyman. 24-2

Farm and dairy manager, with energy, push and proven ability, desires position on large, modern, certified milk or stock farm, institution or private estate where results will be appreciated. Seventeen years' experience in Advanced Registry, pure-bred stock, modern farming and in everything pertaining to the successful management of an up-to-date farm and dairy. Breeding for results a specialty. No proposition too large. Married. Age 38. Excellent reference. Address FARMER AND DAIRYMAN, 4463 North Uber Street, Philadelphia, Pa. 19-spl

Single man, age thirty, wishes position as working foreman on farm. Fully understand modern farming in its various branches, an expert on all up-to-date farm machinery. Lifetime experience, best of references from last employer. ROY E. GARDNER, North East, Md. 25-2

Experienced herdsman, single, wants position. Understands feeding and can produce results. Place where A. R. O. work is done, preferred. Best references. State wages in first letter. Address BOX 538, care Hoard's Dairyman.

Consigned to the Waukesha Holstein Bull Sale — January 12

HIS DAM

PABST WHITE CLOVER 2D

Butter 7 days, 28 months of age.....19.15 lbs.
Milk, 7 days, 28 months of age.....475.00 lbs.

She's a combination of the blood of Korndyke Segis Johanna and King Pontiac Champion.

Dicmere Korndyke Creation

Born July 10th, 1920.

THE COMBINED BLOOD OF:

Sir Pietertje Ormsby Mercedes,
"The World's greatest sire of Show Ring Winners and Yearly record daughters"

Spring Brook Bess Burke 2nd
The 1200-lb. daughter of "The greatest mother of the breed."

Korndyke Segis Johanna
Sire of the World's record $30,000 three-year-old.

King Pontiac Champion
Sire state champion long distance cow, Champion Dora Korndyke.

HIS SIRE

CREATOR

His dam, Spring Brook Bess Burke 2d, has three records over 1,000 lbs. His sire is S. P. O. M.

H. E. DICKENSON

Oconomowoc, Wisconsin

WAUKESHA HOLSTEIN BREEDERS'
SECOND ANNUAL BULL SALE—JAN. 12, '21
70 Pure-bred Holstein Bulls — Six Months to Two Years Old

His sire is S. P. O. M. 41st, the richest yearly record bull in the world. His dam is A. W. P. Alma Coin, a 16-lb. 2-year-old, now on yearly record.

You will find a great number of bulls of this type and breeding from 30- or 40-lb. sires some with yearly record dams with over 1,000-lb. records, and from the choicest young cows, some with records of close to 1,000 lbs.

The man who is looking for a pure-bred bull to increase the production of his herd, grade or pure-bred, will never have a better opportunity for the selection of a good bull from the best blood lines.

Individually Selected and Guaranteed Breeders
[The Holstein Industry is the Most Substantial Farm Industry of Today]

You are invited to come and inspect the choicest lot of bulls ever consigned to a public sale.

Sale commences at 10 A. M. in heated sale pavilion, Waukesha, regardless of weather conditions. Dinner at noon.

There Will Be:

A 10-month-old son of the 30-lb. bull, Colonel Pontiac Korndyke, out of a 24-lb. daughter of Terrace Lawn Hengerveld Segis. She will make between 800 and 900 lbs. of butter in 305 days. She is a sister of the First Prize Get of Sire at the National Dairy Show, 1920.

A 5-month-old son of Creator out of one of the best young cows whose dam combines the blood of Korndyke Segis Johanna and King Pontiac Champion.

A yearling son of Spofford Pietertje Echo out of the 29-lb. Molly Spofford Pietertje. His two nearest dams average 570 lbs. milk in 7 days.

Three yearling sons of Beauty Pietertje Prince 15th out of A. R. O. dams, one of whom is making in the neighborhood of 30 lbs. butter at the present time.

Two yearling sons of Hillvale Endymion out of A. R. O. dams.

Three yearling sons of Pabst Champion Albert, a brother to the State Champion Milk Cow, Champion Dora Korndyke with 1,315 lbs. butter in 365 days, and out of Ormsby cows with A. R. O. records up to 22 lbs.

A son of Carnation Ormsby Pet out of a 21-lb. 3-year-old with 575 lbs. milk.

A yearling son of King Pontiac Boon Artis, sire of the First Prize Senior Bull Calf at the Wisconsin State Fair, 1920.

Two yearling sons of Bairdland Pontiac Champion, Grand Champion Bull at the Waukesha Dairy Show, 1919.

Two yearling sons of Meadow Holm Palestine Ormsby out of A. R. O. dams with records on all sides.

Three yearling sons of King Superba, sire of the first and second prize Get of Sire, Wisconsin State Fair, 1918, out of record dams up to 25 lbs. as 4-year-olds.

Three yearling sons of Pabst Blackberry Korndyke, a brother to the World's Record Three-year-old and out of A. R. O. dams.

Three yearling sons of Hengerveld Salo Beets De Kol out of some of the choicest cows of the breed.

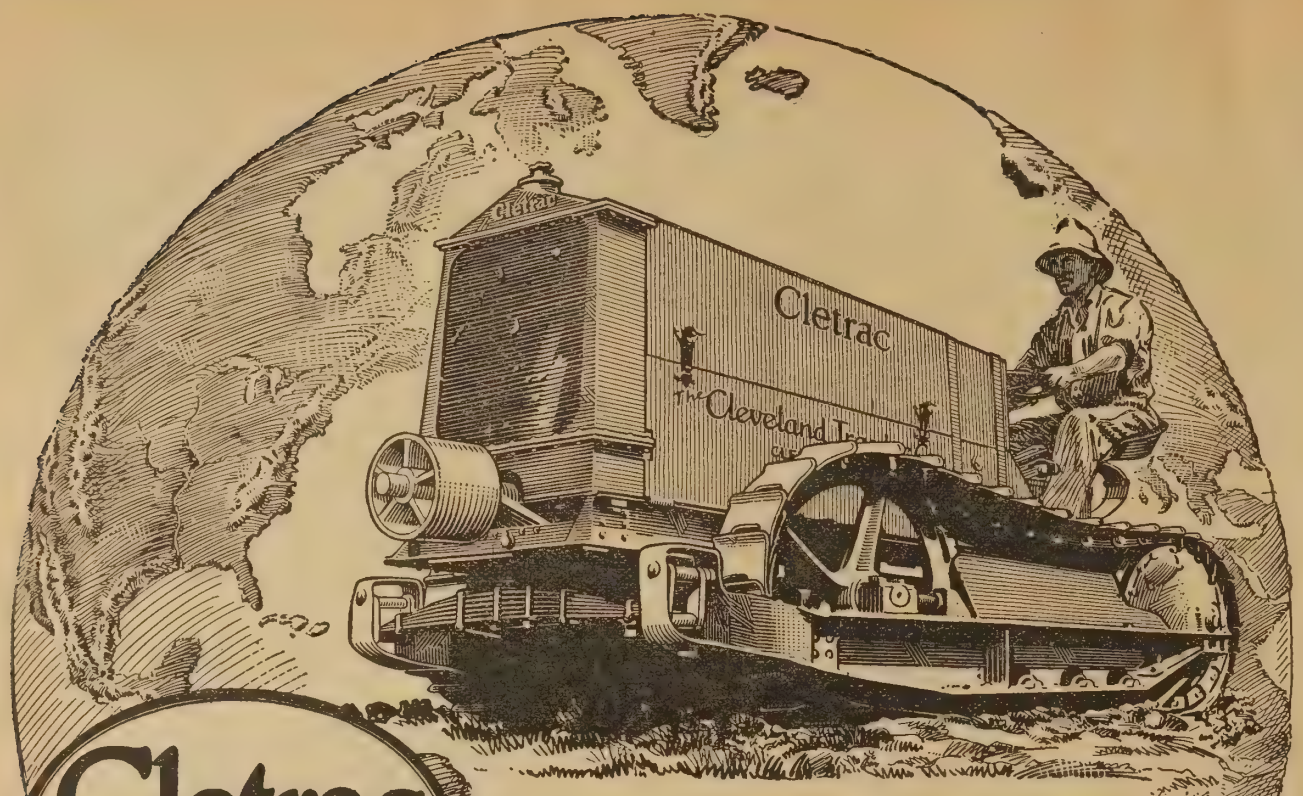
Three yearling sons of Woodcroft Perfection, Wisconsin's first 40-lb. bull with a yearly record dam of over 1,000 lbs.

OTHERS EQUALLY AS GOOD. AN OPPORTUNITY TO SELECT A "BRED FOR PRODUCTION" BULL AT YOUR OWN PRICE

Get a Catalogue at the Sale

Waukesha County Holstein-Friesian Breeders' Association

Waukesha - - - Wisconsin



A yearling son of S. P. O. M. 43rd, sired by S. P. O. M. and from the famous Aaggie Wayne Peep with over 1,235 lbs. butter in 365 days. His dam is Ashburn Hengerveld Dora with over 30 lbs. butter in 7 days. See the catalogue. He's a show bull.

A yearling son of Sir Korndyke Fytje Pietertje, whose dam is one of the best daughters of S. P. O. M., World's Greatest Sire of Yearly Record Daughters. His dam is a young cow that has 27 lbs. at the present time and will be tested again before the sale.

Each animal comes from a state or federal tested herd and is sold subject to a 60-day retest.

Cletrac
TANK-TYPE TRACTOR

EASY ON A TRACK THE CLETRAC WAY

SPECIFICATIONS

Horsepower: 12 at drawbar, 20 a belt pulley.
Length: 96 inches.
Width: 50 inches.
Height: 52 inches.
Weight: 3420 pounds.
Turning Circle: 12 feet.
Traction Surface: About 800 square inches
Center to Center of Tracks: 38 inches.
Belt Pulley. Dia. 8 inches, face 6 inches.

"Stands Up" The World Over

CLETRAC carries power farming to the four corners of the earth. Its ground-gripping tracks, its heavy-duty motor and its sturdy construction are helping to modernize the farming customs of sixty-five countries.

In the far North where the short season makes speed the first consideration, Cletrac's "more work per day" ability has won prompt popularity among the farmers. And it is equally in demamd in tropical countries where man and beast so quickly succumb under the burning sun.

Cletrac's ability to stand up under constant use counts most in the far places where broken or worn parts may mean weeks of idleness. And, of course, it's just as big a factor in Cletrac's year-'round dependability here at home, too.

The Cletrac story of power farming is told in the interesting booklet "*Selecting Your Tractor.*" We will gladly send you a copy on request.

What of Denmark

HOARD'S DAIRYMAN:—Denmark, the home of cow testing associations, has nearly 700 active associations. In the United States there are fewer than 500 and yet Denmark is one-sixth the size of the single state of Iowa. The first associations were organized in 1884 and still operate. Soon after their organization the Danes sent nineteen young testers to Russian Poland to introduce the work into that territory. This was the first piece of International Dairy Extension work on record.

Somewhat on the same plan, a number of Danish dairymen visited the United States last summer. They reserved space in the National Dairy Show and also in a New York show for a dairy products display. In New York they invited a large number of distributors to banquet with them and told them of dairying in Denmark. Now these same men sell thirty-three per cent more Danish butter each month than was imported from all countries during 1919. Twelve million pounds, or enough to feed the entire United States three days, arrives each month and is bought readily because of its advertised quality.

When Denmark has a surplus, or the price drops, she makes a market. In the United States we resort to selling our cows, closing our condenseries—one of the largest has shut all but three of their twelve—and wailing about the market.

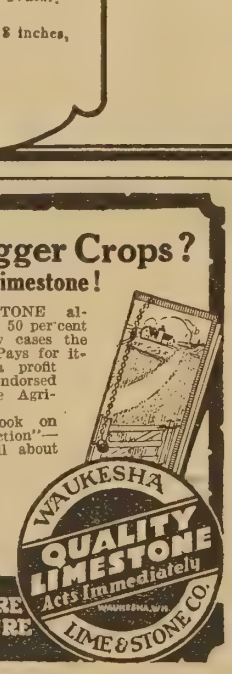
TEMPLE R. LOVETT.
Iowa College of Agriculture.

The World's Cow Testing Associations

A recent news letter from the Canadian Department of Agriculture contains tables showing the number of cow testing associations in operation in the various countries of the world during 1919 and in the years preceding the great war. These figures were taken from a report issued by the Co-operative Danish Agricultural Societies and entitled "The Dairy Record Associations During Twenty-five Years."

We give below the table showing the number of associations in operation during 1919, together with their membership and the number of herds tested:

Country	Associations	Members	Cows
Denmark	636	15,000	208,900
Sweden	427	5,503	102,812
Norway	102	2,080	23,286
Finland	142	2,463	41,927
Germany	333	4,560	135,540
United States*	468	11,498	203,472
England	44		32,000
Scotland	22	426	17,827
Canada*		3,847	33,382



*Figures given are for the year 1920 instead of 1919.

Pure-bred or grade dairy cows frequently earn for their owners 25 to 100 per cent more than the returns received from scrubs.

Want Bigger Crops?
—Then Use Limestone!

QUALITY LIMESTONE always increases crops 50 per cent or more. In many cases the yield is doubled. Pays for itself and returns a profit the first year. Endorsed and used by State Agricultural Dept.
Write for free book on "Increasing Production"—it will tell you all about QUALITY LIMESTONE and what it will do for you.

Association Notes

(Continued from page 1085)

ground oats, $55; hominy, $45; N. H. Dairy, $63; silage, $10; hay, $25—$28.

Claremont and Lebanon, New Hampshire:—Five unprofitable cows were sold in November. There are 24 cows on official test. Five of the twelve separators tested this month need adjustment. For 3.7% market milk, a price of $4.22 was received, plus 6c for each point above this test. Fat sold at the creamery for 67c per lb. Milk retails for 14—16c per quart and butter for 75c per lb. Local feed prices are: Bran, $50—$55 per ton; cottonseed meal, $58—$75; corn meal, $48—$68; gluten feed, $55—$75; linseed meal, $62—$80; ground oats, $50; hominy, $69; beet pulp, $70; Union grain, $80; mixed hay, $20; silage, $8.

Clinton, Pennsylvania:—More heifer calves are being raised than last year due to records which have pointed out the profitable producers. One carload of gluten, one of cottonseed meal, and one of bran were bought cooperatively by the testing association and the Grange. Most of the members selling milk have signed the Dairymen's League contract. Three per cent milk sold for $3.65 per cwt. and 4c per point above in November. Fat sold for 63c per lb. at the creamery. Milk retails for 7c per quart and butter for 67c per lb. Feed prices are: Gluten, $60 per ton; bran, $43; cottonseed meal, $64; oil meal, $65; corn and oats, $49; corn meal, $67.

When writing advertisers please mention Hoard's Dairyman.

A Story About Wheat

(Continued from page 1089)

equal of Red Fife. It is a bearded wheat with rather long heads. It will be easy to remember among the other spring wheats for it is the only one of the important varieties that is bearded. It has been called various names in different sections of the wheat belt, Preston, Velvet Chaff, and Blue Ribbon being among the commonest ones.

Our Canadian Juniors and also those living in the great Northwest of this country will wonder why we have not said anything about Marquis spring wheat. We have kept this one for the last because we believe it is the most important variety of hard spring wheat being grown at the present time. For this valuable addition to spring wheat varieties we are all indebted to Dr. Charles E. Saunders of Ottawa, Can.

He crossed Red Fife on a spring wheat known as Red Calcutta. This was done about 1892, but it was not until about the year 1900 that the selection was made which resulted in the prize Marquis. What Dr. Saunders was trying to find or produce was a wheat that would ripen earlier than Red Fife, but that would still have the good milling qualities of Fife. So he figured if he crossed Red Fife on a variety like the Calcutta, an early variety, he might combine the qualities of the two in a new wheat. And that is exactly what he did. Marquis ripens about a week earlier than Fife and its milling qualities are just as good and perhaps a little better. He called this wheat Marquis, I presume, for the reason he regarded it as the nobility among all other varieties. Because it is early, it usually yields a better crop than Fife.

Marquis wheat is beardless and smooth chaffed like Fife, and it is rather difficult to tell the two apart. However, upon close inspection, it will be seen that Fife heads are a little longer and they are not quite as compact as Marquis. Because it looks so much like Fife, we shall place it in the Fife group already referred to. The kernels are short and stubby with quite a wide V-shaped crease. A bushel of good Marquis will give about 40 to 45 pounds of flour of fine quality.

It seems almost unbelievable that this wheat which is now so popular all came from a single head. But such is the case, and were it not for just such patient men as Dr. Saunders, spring wheat growers would never have known this wonderful variety.

Junior Letters

Hoard's Dairyman Juniors:—We live on 42 acres of land and have 11 cows and a bull. I have a rabbit and expect her to have little ones. I have a Guernsey cow and she will have a calf soon. I have no brother or sister. I am in the 7th grade. I like to read books and interesting stories. We have two horses and two pigs. I have 28 White Leghorn chickens that will lay this winter. Wishing good luck to the juniors.

Oregon. Henry W. Meyer.

Hoard's Dairyman Juniors:—I live on a sixty-acre farm. We are milking three cows and have a heifer that will freshen soon. I have a high grade Holstein calf. Papa gave it to me. He also gave me a sow. She had six little pigs and I sold them for $5 apiece.

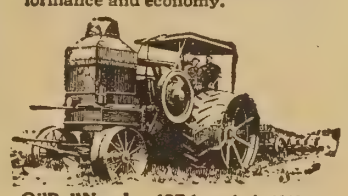
Papa is trying to get the county agent to start a calf or pig club.

We have had bad luck this summer. Three of our horses died.

I would like to have some of the juniors write to me. My address is R. F. D. 1, Centreville, Mich. Leo Cook.

Hoard's Dairyman Juniors:—I have a calf, lamb, and seven chickens. I live on a farm of 300 acres. We have 20 cows, 4 head of young stock, six horses, fifteen pigs, and 150 sheep. Good luck to all the juniors. I wish some of the juniors would write to me. I will answer every letter. My address is Hoosick Falls, N. Y. Harry Guiden.

"Old Number One," the first OilPull, built in 1909, has worked ever since and isn't half through. Repairs cost less than 5c a day. Owned by Frank Schultz, Agar, S. Dak.



OilPull Number 174, built in 1909, 12 years ago. The owner, C. J. Chandler, Lincoln, Kan., says it will last another decade. The only renewed parts of motor are four piston rings.

OilPull Number 314, owned by F. Gasperich, Onida, S. Dak. Built in 1909, it has cropped from 600 to 900 acres a year. Pulls eight bottoms in soil so tough that eight horses can't pull a single bottom.

"The Swamp Angel," so named by proud admirers in Northern Indiana for its ten years' work in the muck of the famed Kankakee. Has a record of marvelous performance and economy.

OilPull Number 437, bought in 1910, owned by James Moss, Blue Island, Ill. Is still "young" after 11 years of hard, faithful work on the farm, and moving buildings at odd times.

Buy a Tractor on Performance —*not* Promise

THAT'S the one right way to buy a tractor—not on promises of what it *may* do, but on the record of what it *actually has done* over a long period of years in the hands of thousands of owners.

The twelve year performance record of the Rumely OilPull tractor stands out as a safe guide post to the tractor buyer.

The first OilPull tractor, built over twelve years ago, is still on the job. And hundreds of other old OilPulls—still going strong—prove that unusually long life is the rule with the OilPull, not the exception.

And the OilPull you buy today has the same basic features of design and in addition is greatly improved and refined through twelve years of field service and constant factory tests. That is why the OilPull is, as it always has been, cheapest in cost per year of service.

The OilPull tractor has for years held all the world's official tractor fuel economy records. It is the only tractor with which is given a written guarantee to successfully burn kerosene at all loads and under all conditions.

Economy of upkeep is as marked. Less than $200 has been expended on "Old Number One" for repairs during its twelve years of work.

Truly, it is the part of wisdom to prefer a tractor with a record of performance such as this and in addition you have the assurance of such splendid features as 25% overload capacity, cooled with oil, double system of lubrication, Hyatt Bearings, and Rumely service including a factory trained expert for every ten tractors in use, scattered throughout the length and breadth of the land.

There are four sizes—one to fit your farm—3 to 10 plow. Talk with your Advance-Rumely dealer or write us direct.

"You Get More Milk or Your Money Back"

Butter Markets Hold Firm

[Report by U. S. Bureau of Markets.]

After almost a month of weak and unsettled conditions butter markets appear to have taken a turn upward. For the week ending Dec. 18, trading was considerably better and there was a firmer tone on all markets. An important factor in stimulating consumptive demand, thereby causing more active trading on the wholesale markets, was the fact that retail prices, which up until recently have been relatively high, were brought down to lower levels.

Storage Butter Surplus Heavy

The monthly cold storage report shows that total holdings in the entire country on Dec. 1 were 79,889,000 lbs. This is a surplus of 6,235,000 lbs. over last year, and 14,779,000 lbs. over 1918 on the same date. The reduction of stocks during November this year amounted to 21,889,000 lbs., as compared with a reduction during November, 1919 and 1918, of 26,820,000 lbs. and 15,763,000 lbs. respectively. The storage movement in the four large markets is much lighter than in 1919. During November last year the reduction in the four large eastern markets represented close to 75% of the total reduction in all storages, but this year the reduction was less than 60% of the total. A year ago the situation was helped somewhat by export trade, which during the last three months of 1919 relieved domestic markets of some 7,700,000 lbs. of butter, much of which no doubt came out of storages. This year, however, there is practically no export trade and in addition importations are an influential factor in the slow movement of storage stocks.

Foreign Arrivals Lighter

No large cargoes of foreign butter arrived during the week. Butter from the heavy cargo of a week ago was available on the New York market, and showed up better than some of the recent shipments. Orders for Danish butter have been considerably checked by lower domestic prices. Even the low prices quoted on new offerings do not look particularly attractive to buyers. Some shipments are coming on consignment, and others have been shipped subject to inspection by the buyer and guaranteed free from mold. There are said to have been rejections on a few of these lots. Recent importations include small lots from Holland.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending December 18, 1920, and the corresponding week last year were as follows:

	Week ending Dec. 18	
	1920	1919
	Cents	Cents
New York	54.53	73.00
Chicago	50.71	67.00
Philadelphia	54.83	73.20
Boston	52.83	71.80
San Francisco	47.41	65.90

The receipts of butter at these markets for the week were 5,549,940 lbs. as compared with 5,160,546 lbs. a year ago and 6,196,354 lbs. last week.

Accredited Herd List

Accredited Herd List No. 3, just issued by the United States Department of Agriculture, is the official record of progress in tuberculosis eradication under the accredited herd plan. So extensive has the work become that the list of accredited herds, together with summaries, requires 52 printed pages and three times as large as a year ago. And this does not include herds which have successfully passed one official tuberculin test with a view to being accredited. Such herds are listed in two supplements to the main list.

Accredited Herd List No. 3 is now

4,200 Eggs From 48 Hens

Simply write me and I will send you a big double size box of my famous **Buttermilk Compound Tablets** by return mail, postpaid. I want you to know that you can double and treble your poultry profits by doubling or trebling your egg yield—perhaps get five to seven times as many eggs as did many of my friends last winter by using these wonderful tablets. Fed in drinking water or feed. Because I want these tablets known in every township in America I say: Try them at my risk. If you like them, tell your friends. If not, you are not out a cent.

Over 10,000 People Wrote Me Last Year

Here are a few samples of the kind of letters I get from all parts of the United States.

4,200 Eggs.

I used two boxes of your tablets. Before using them got only 6 eggs a day. Within two weeks was getting 12 to 15 eggs a day. In seven months I got about 350 dozen (4,200) eggs from my 48 hens. I did not have any Roup. I give your tablets the praise.
MRS. ARTHUR TUCKER, Wilkinson, Ind.

75 Eggs Instead of None.

I found the tablets were fine to start hens to laying. Before using the tablets I wasn't getting any eggs. Within 10 days after using tablets increase started. I was finally getting 75 eggs a day and fed the tablets until spring.
MRS. R. H. TULTZ, Scranton, Kans.

Makes 'Em Lay in Coldest Weather.

Last winter I fed two boxes of your tablets mixed with feed. Before using tablets got only 12 eggs a day—afterward 30 to 36 eggs a day. This was within three weeks. After feeding the tablets six weeks got 50 and 60 eggs a day and in the coldest weather in winter.
MRS. ELMER HOTTMAN, Ridgeway, Wis.

Best Tablets Made.

The Buttermilk Compound Tablets I think are better than the common tablets. I got more eggs within two weeks after using them. I have some other tablets but the "Buttermilk" are the best. I fed three boxes last winter. My flock did not have the Roup. Will send for more tablets.
MRS. WALTER ELLIS, Gypsum, Kans.

30-DAY FREE TRIAL

Because I want one million new users of these wonderful tablets I am willing to send you a big double size box if you will just write me. Your name and address is all I need. Use a postal card if you wish—I'll send the tablets by return mail, post paid. You use the tablets 30 days then report results to me. If **you are not satisfied in every way—if you are not more than pleased**—the tablets are to cost you nothing. But if you do find that you get many, many more eggs—probably three to five and even seven times as many—and your flock is healthier than ever before—full of pep and strutting around with healthy red combs—the tablets cost you only $1.00. No matter what you have tried before, I want you to remember that my secret formula is absolutely different from anything else—that it has been known to succeed where others failed. Not only that—you must remember that I send you a big double size box—nearly three times as big as the ordinary box of tablets.

At any rate, the risk is all mine. You can't afford to pass up this Special Introductory offer a single minute—it may never be made again.

Send No Money — Just Write Me, That's All.

All I need is your name and address—just put it on a postal card or use the coupon below—I'll understand and send you the tablets post paid by return mail.

New York Dairy Production

The following report of New York's dairy production for 1918 and 1919 has just been released by the State Department of Farms and Markets:

	1918	1919
Number of plants reporting	1,742	1,432
Number of dairies supplying milk		84,766
Number of cows producing milk	1,023,034	1,172,727
Milk received during year, lbs.	4,436,932,413	5,329,769,749
Milk received during June, 1919, lbs.		629,330,085
Milk received during Dec., 1919, lbs.		274,651,979
Milk received during April, 1920, lbs.		420,813,040
Milk sold for human consumption, lbs.	2,341,401,288	2,443,471,352
Cream sold for human consumption, lbs.		61,681,768
MANUFACTURED PRODUCTS	Lbs.	Lbs.
Creamery butter	13,897,740	14,056,768
Whey butter	528,965	773,070
Whole milk American cheese	37,610,008	62,568,829
Part skim and whole skim American cheese	3,878,645	3,126,731
Limburger cheese	4,455,674	4,473,824
Swiss cheese	1,170,239	1,733,384
Brick and Munster cheese	1,453,914	2,119,122
Cottage, pot, baker's and hoop cheese	12,160,255	12,242,493
Cream and Neufchatel cheese	3,085,617	2,625,217
Italian and Greek cheese	1,567,892	2,950,313
All other varieties of cheese		2,696,229
Condensed milk (whole and skim)	236,518,941	426,268,709
Evaporated milk (whole and skim)	91,428,870	68,388,232
Powdered or dried whole milk	2,397,397	4,130,523
Powdered or dried skim-milk	12,075,712	15,112,589
Powdered or dried cream	534,906	535,349
Dried casein	2,203,244	2,874,825
Milk sugar	1,707,235	703,255

The report for 1919 shows the average number of cows per dairy was 13.83 and that the average production per cow was 4,544.8 pounds.

Building
Stamina Into Case Tractors

IN CASE shops, under the terrific impact of a constant stream of accelerated blows of huge steam hammers, white hot, high carbon steel is accurately formed into forged driving gears, front axles, crank shafts, cam shafts, connecting rods and numerous other important parts of Case tractors.

The many high-grade, steel forgings, ***heat treated*** and ***carbonized*** put ***strength*** and durability into Case tractors without unnecessary weight.

These items are only a few indications of the high quality features that make Case tractors superior.

Each part that goes into the construction of Case tractors is made and put in place with the same conscientious, efficient thoroughness that marks the manufacture of every forged part.

Extra strength is built into Case tractors to protect Case users against delay and loss frequently experienced with tractors not made to the Case standard.

Barren Cows

Must Be Made to Breed or Your Dairy Business Will Be a Failure. They

Can Be Made to Breed

By the use of

Hood Farm Breeding Powder

We say this confidently because it has been used with such marvelous results by so many breeders. Every cow at Hood Farm is treated with the Breeding Powder, and we know that it does make barren cows and heifers breed; we know that it checks and prevents abortion; we know that it makes cows clean quickly, thereby saving us hundreds of dollars annually.

Order today, mentioning this paper.

Prices prepaid $1.15, $2.75 and $5.00. Flexible Injection Tube, by mail, 90c. Mammoth size Breeding Powder and Tube, prepaid, $5.75.

C. I. HOOD CO., Lowell, Mass.

Pronounced Incurable

SAVE-The-HORSE saves

"Bone Spavin cured with Save-The-Horse four years ago. Never taken a lame step since." O. C. Williams, Modesto, Ill. "Bog Spavin and Thoropin—absolute cure and removal of enlargements. Bad case." Chas. R. Moulter, Erin, N. Y. "Ringbone, Spavin and Founder all treated with success with Save-The-Horse." Chas. Phillips, Fairbank, Iowa. "Cured worst case of Thrush any man ever saw, and it was pronounced incurable." John Hittson, Bradyville, Tenn.

Over 300,000 satisfied users. **SAVE-THE-HORSE** has more than 27 years' success curing even the worst cases of Ringbone, Thoropin, SPAVIN—or Disease of Shoulder, Knee, Ankle, Hoof or Tendon—when all other remedies have failed. It is sold with a signed **Guarantee to CURE or RETURN MONEY.** Use it once and you'll always depend upon it. Send today for FREE 96-page BOOK on how to locate, understand and treat all lameness; also sample of GUARANTEE and expert veterinary advice—all **FREE.**

Smooth Potatoes

assured to every farmer if he will first rid his seed potatoes of infection by using:

FORMALDEHYDE
The Farmer's Friend

The official standard seed cleanser. Gives increased yield of from 30% to 40%. Potato scab and black-leg once in the ground may persist for many years. U. S. Dep't of Agriculture recommends cleansing all seeds with *Formaldehyde* solution to prevent the spread of potato diseases. Also positively destroys smuts of grain and fungus growths. One pint of our *Formaldehyde* from your dealer treats 40 bushels of seed. New illustrated book sent free on request.

A GUARANTEED REMEDY FOR CONTAGIOUS ABORTION

Save calf, cow and herd by the use of *Aborno*. Easily administered by hypodermic syringe. Kills abortion germs quickly without injuring cow. Write today for free booklet with letters from users and full details of our moneyback guarantee.

ABORNO LABORATORY
28 Jeff St. Lancaster, Wis.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Accidental Abortion

It is possible for premature expulsion of an embryo calf, or fetus, to be induced by accident, but instances of this are comparatively rare. Germ infection is the cause in almost all cases of premature birth of a live or dead fetus, as it is of calves that are born at full time but so weak that they quickly succumb and promptly decompose. Such calves at one time were termed "living abortions" by stockmen.

The unborn calf sometimes is killed in the womb and either expelled promptly or when partially decomposed and it possibly may be retained and become mummified. Death of a fetus from accident (traumatism) usually results from horning by another cow, a kick from a horse, a bad fall, squeezing in a narrow door, or other severe accident. Death of a fetus, not due to traumatism, may be incidental, by which we mean that it is the result of conditions, circumstances of agents affecting the cow injuriously in one way or another, yet not the result of abortion germ infection. Of these the following may be mentioned: Drugs, such as aconite, aloes, sulphates of iron and copper, iodide of potash and ergot, given medicinally, and others; ergotism, from prolonged consumption of the ergot fungus (Claviceps purpurea) in grain, meal, grass, hay, or straw infested by the poison; acute deranging attacks of indigestion or other serious disease, including anthrax and hemorrhagic septicemia; starvation; twisting and knotting of the umbilical cord; exposure to storms; moldy feed, etc.

No matter what may be thought to have caused abortion the affected animal should be treated as if known to have aborted from abortion germ infection. This is the more necessary when it is remembered that germ infection may be the actual cause and accident or incidental irritation the aggravating or contributing cause. The fetus, afterbirth, and all soiled bedding should be burned or deeply buried and the stall the cow has occupied cleansed, disinfected, and whitewashed. The womb of the cow should be cleansed and disinfected by a specially trained veterinarian possessed of the necessary modern instruments for the work and the skill required for their efficient employment. The vagina should then be douched daily for at least a week with lukewarm, boiled water containing a heaping teaspoonful of table salt, or such antiseptic as the veterinarian may prescribe. It may also be necessary to repeat the treatment of the womb. The vaginal injections should be repeated daily for two weeks or more before the animal is rebred and that had better not occur until the time she would have been bred had she not aborted.

All cows that abort from any cause also should be kept isolated until known to be safely in calf and the veterinarian may consider it necessary to give mild antiseptic vaginal douches several times a week, after service, until it is seen that the cow is not going to come in heat. It is deemed unlikely that abortion will recur when these precautions are taken and the "uterine seal" or "plug" has perfectly formed.

Impending abortion may sometimes be prevented by medicinal treatment, if applied before death of the fetus. The drugs usually employed for this purpose, under direction of the veterinarian, are fluid extract of black-haw (Viburnum prunifolium), cannabis Indica or Americana, and tincture of opium, but there is no specific preventive.

Hematuria

I have a cow that passes red water. I have seen her pass red water a couple times about three weeks ago. I would like to know if there is any cure for it.

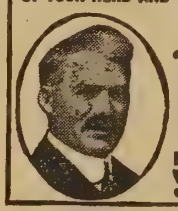
Mt. Vernon, Wash. B. W.

This ailment is common among cattle in your state and is supposed to be caused by protozoa or irritants in wild pasture or water. The experiment station of your state may have discovered some specific treatment, but we are not aware if that is the case. Write the veterinary department on the subject. Meanwhile it would be well to keep the cattle off wild pasture and give them sound feed and drinking water from a deep well. In the feed twice daily mix a heaping teaspoonful of a mixture of one part of dried sulphate of iron and two parts of powdered alum. Gradually increase the dose as found necessary. Iodide of potash in dram doses two or three times daily also has given good results in some cases.

Hard Milker

I bought a Jersey cow last October thinking she was all right every way but when I got her home I found it extremely difficult to get her milk. She simply won't or can't give the milk down except a few drops at a time. It takes an hour to get a gallon from her. I let the calf suck but it can't get all the milk either and I have to take time to milk her out every day to keep her udder from spoiling.

Ponce de Leon, Mo. T. R. W.



If the milk is held back by growths or strictures in the ducts of the teats such condition possibly may be overcome by operation with dilators first and by cutting with a bistoury or removing growths by scraping downward with a sharp edged cone shaped instrument. If no such causes are present we should advise drying off the secretion and fattening the cow, as there is no specific remedy in such cases.

New York Breeders Meet

(Continued from page 1073)

securely. All will stay by when the tendency is upward, but when downward there comes a change of feeling, this not because the farmer is mean but he lacks the education that enables him to see right on the question.

The closing address was by Mr. Teal of the Onondaga Creamery Association. The farmers formed an organization with a capital of $150,000 and issued bonds that were taken also by the farmers, to the extent of $250,000. They have the finest equipment that is known probably in any creamery and a splendid brick building. It was the thought of the association to retail milk, but it was seen before they were ready to open the business that the dealers would refuse to buy, and on the morning of opening there was only one dealer who bought. He took about 200 quarts. The association then had to equip and enter the retail trade. They sent out a dozen or so solicitors but could only get a trade of about four thousand quarts. This has been increased to about 10,000 quarts. Meanwhile the small dealers have been coming to them slowly and whenever they come they are furnished milk and his trade given back to him. Moreover, attempts are made to get the trade of these dealers segregated within certain areas and so eliminate the long routes and much expanse. The prospect for the future of the association is unquestionably bright.

Officers elected for the ensuing year were the following: president, Harry S. Gail; vice-president, C. P. Miller; secretary, Albert E. Brown; treasurer, Wing R. Smith.

New York. H. H. LYON.

Northwest Ayrshire Breeders Organize

Ayrshire breeders of the Northwest met at Portland November 17th and organized the Northwest Ayrshire Breeders' Association. Officers elected were: J. R. Maben, Oregon, president; E. W. Van Tassell, Washington, first vice-president; J. U. Smith, Oregon, secretary. The association will represent Oregon, Washington, Idaho, and British Columbia.

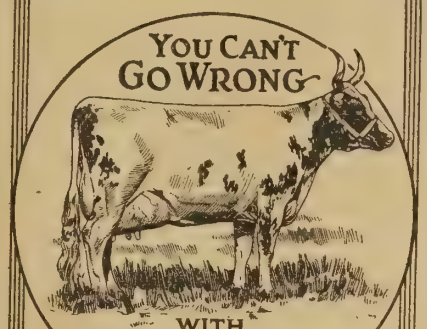
Can Home-grown Rations Supply Proteins of Adequate Quality and Quantity for High Milk Production, by E. B. Hart and G. C. Humphrey. From the Departments of Agricultural Chemistry and Animal Husbandry, Uni. of Wisconsin, Madison.



EXERCISER FOR BULL

A bull confined in an ordinary yard will very frequently not get sufficient exercise. In this case he may become very lazy and in some cases an uncertain breeder. In order to give his bull an opportunity to exercise, a Wisconsin dairyman hung a fair sized stump on a chain and suspended it from a cross bar between two poles in the bull's yard.

The accompanying photograph shows the bull enjoying himself with his exerciser. On cold days he seems to particularly enjoy it and often spends hours bunting it.—D. S. BULLOCK, Washington, D. C.

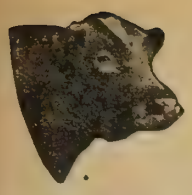
"Get" of Pencoyd's Secret Marose

This bull won first prize, senior and grand championships at the New England Fair, Connecticut and New York State Fairs. His "get" (4-mo.-old calves) was first at The Eastern States Exposition and fourth at the National Dairy Show with thirteen "gets" shown. His heifer calf, Appletree Point's Dolly Dimple, was Junior Champion at New England Fair, first prize at Eastern States Exposition, and was Junior and Grand Champion female at Connecticut State Fair. His bull calf was unbeaten in all eastern shows and won at Waterloo and National Dairy Show. Write for prices on May Rose calves that combine type and production.

U. A. Woodbury, II Burlington, Vermont



For Sale—A Bull Calf of Real Merit

Dropped Aug. 28, 1920, and Sired by **Langwater Cavalier 21012**, whose daughters have put him to the front as one of the great bulls of the breed. His highest record daughter made 734 lbs. fat in F.

The dam of the **Bull Calf** is Georgette of Edgemoor, who is on test and is a daughter of Mildred II of Les Godaines (55120), who was the **Grand Champion** Cow at the **National**. Her record is 14,890.9 lbs. milk, 702 lbs. fat. Her daughter **Century Girl** was first prize two-year-old.

The **Bull Calf** is a fine individual and splendidly marked. Send for extended pedigree and full description. A few choice females to offer.

Upland Farms, Inc., Ipswich, Mass.
F. P. Frazier & Son, Proprietors, W. K. Hepburn, Manager

Economy in Production ← GUERNSEYS → Quality of Products

One Guernsey cow has produced over 1,100 lbs. of butterfat in one year, and 6 have produced over 1,000 pounds. The total production in one year of these 6 cows is equal to that produced by 36 cows in an ordiary herd. Guernseys are not only large producers but their milk is better than ordinary milk. This combination means most money for the owners. Send for our free literature.

THE AMERICAN GUERNSEY CATTLE CLUB, Box H19, Peterboro, N. H.

SON OF NE PLUS ULTRA

We are offering several of his sons and daughters. Also sons and daughters of our other herd bull, who is a son of Golden Secret of Lilyvale and a half brother of Nellie Joy IV, 1,019 lbs. fat. Eighteen of his half sisters average over 600 lbs. fat. Write or come and see them.

W. W. Clark, Vesper, Wisconsin

Daughters of Anton's King Confidence (43517)

These heifers are not for sale but one glance at them tells you that *Anton's King Confidence* sires the kind you want in your herd. Since we value his females too highly to set a price on them your only opportunity is to get one of his sons for your next Herd sire. We have several growthy, vigorous and well put up young fellows ranging from 9 to 15 months of age for sale at the present time. We appreciate your inquiry. Send for our circulars.

Kentucky Dairy Meeting

A big dairy meeting will be held at the Kentucky State University, Lexington, February 3. The speakers include B. H. Rawl, Chief of the Dairy Division and W. W. Fitzpatrick, southern representative of the American Guernsey Cattle Club. Mr. Neil Roach will tell about the food value of milk according to the latest scientific researches on the subject.

A number of fine cows will be brought before the audience and premiums will be offered for correctly rating them. Coldstream Farm and the University will furnish cows for this judging contest.

Premiums will be offered for the best samples of milk, cream, and butter that are sent to the meeting.

Meetings will be held by the creamery men, the Jersey cattle breeders, and the Holstein breeders.

February 4 forty-four head of Holstein cattle will be sold by the Holstein breeders of the state. Each breeder is contributing a few animals. A trip will be made to Coldstream Farm. J. J. HOOPER, Sec'y.

Leaking Teat

We have a cow that had the end of one of her teats cut off by barb wire. Since it has healed the milk keeps running out all the time.
Three Oaks, Mich. J. A. P.

Apply flexible collodion to the tip of the teat after each milking. If this does not suffice, a rubber thimble will have to be devised and applied between milkings.

Minnesota Holstein Breeders' Association

Be sure that you buy Minnesota Holsteins from state association members. They are responsible. For list of members and other information address

THE SECRETARY, 406 MARKET BANK BUILDING, MINNEAPOLIS, MINN.

If Holstein Breeders' Were Profiteers

But then — they are not!

They would not do much advertising — they would not sell a single animal — they would hold onto every one they had, every one they could get, and everything that was born on their farms.

BECAUSE

We are just about to feel the swing to the opposite extreme of what we have been experiencing in Holstein prices. We look to see them increase, and probably exceed what they have been in the past.

And the fellow who keeps what he has, and buys everything he can possibly get, is the one who is going to be on Easy Street this time next year.

THIS IS THE BUYERS' MARKET.

VERY SOON, YOU WILL SEE THE SELLERS' MARKET.

And it will be better to buy now than to be sorry a year from now.

Good thoughts materialize. Let's all get together and wish good things, think good thoughts and

BOOST.

ARDEN FARMS, 602 Merchants Bank Bldg., St. Paul, Minn.

How Much Air Does A Cow Need

This Is The Answer:

"A cow needs TWICE the WEIGHT of pure air that she needs of FOOD and WATER combined!"

Pile up two days' rations of hay and silage and grain; beside it put all the pails of water a cow will usually drink in two days and two nights.

The WEIGHT of that feed and water equals the weight of fresh air a cow requires during 24 hours.

If the stable were air tight and no fresh air brought in, the cow would die, just as a fire choked with ashes would soon die, though it be supplied with coal or wood.

Of course, no stable is air tight; but in the colder states, most stables are built as tight as possible, to insure warmth.

Unless sufficient ventilation is provided, this means that the cows will not get enough fresh air.

Some Fresh Air Not Enough

They will get *some* fresh air, and so do not die; but they get *too little* fresh air, hence their vitality is lowered and diseases such as tuberculosis may get started.

Health is affected and expensive feeds given them are not properly assimilated; the milk yield falls.

But how bring in plenty of fresh air and yet have warmth?

Prof. King of Madison, Wis., to a great degree solved that problem.

Mr. James and his associates, because of many years' experience in solving ventilation problems, have developed improvements.

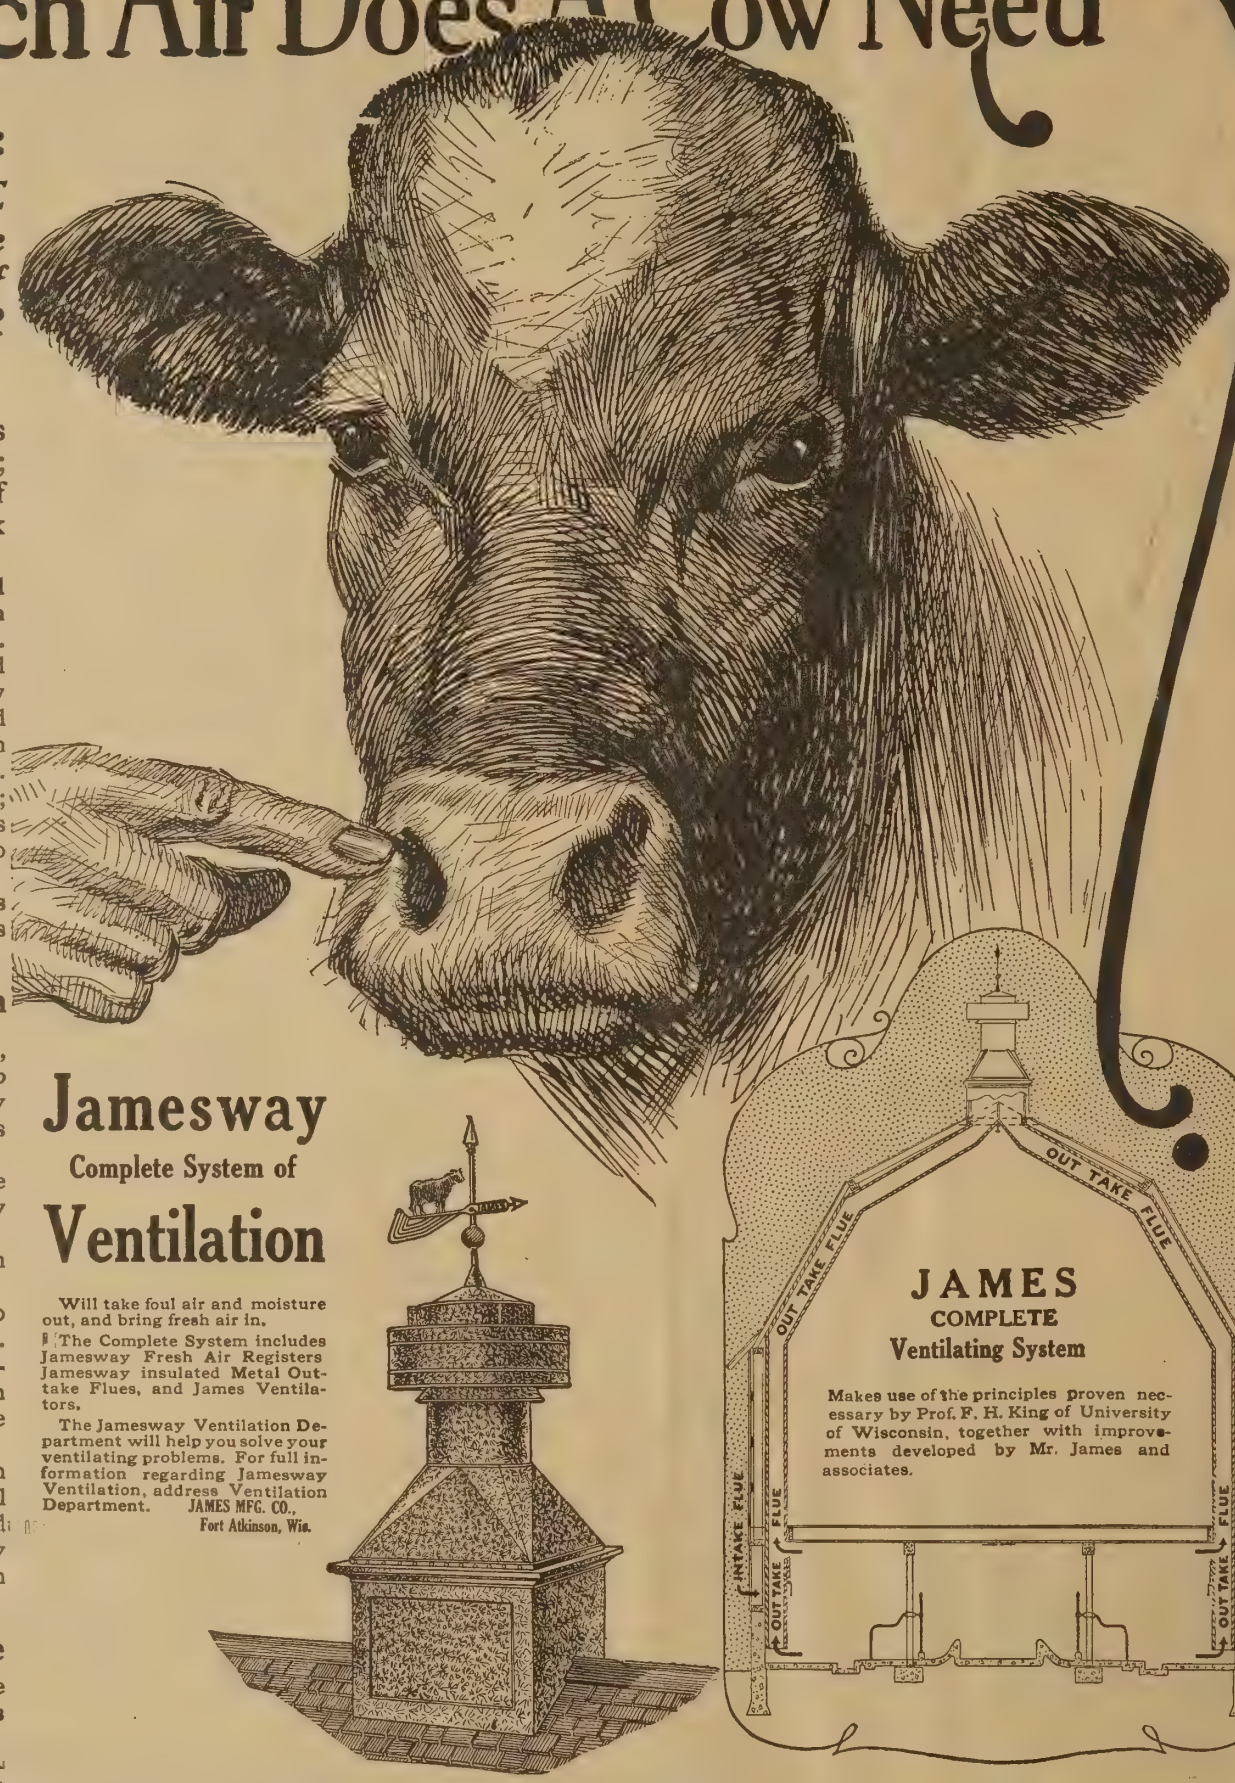
The James complete ventilation system, including insulated metal outtake flues, intake registers and and James ventilators, enables any farmer to have fresh, pure air in the barn.

Get Rid of Excess Moisture

Thirty cows will load the stable air with one and one-third barrels of water daily.

If that amount of moisture is permitted to stay in the barn, harmful results will follow. It is this excess moisture that causes the disagreeable "steaming" so noticeable in many barns on cold days.

"Steaming" is a sure sign that moisture is excessive and that the air in the stable is not being changed with sufficient frequency to keep it fresh and pure.



James system removes excess moisture.

Is Your Barn "Steamy?"

How about your barn? Is it "steamy?" Is it full of foul odors? Are your cows losing in health for lack of fresh air? Is impure air cutting down your milk yields?

These are intensely practical questions. To make milk requires feed, water and pure air. Why buy expensive feeds and not provide plenty of water and fresh air—water and air are free.

If you are interested in this subject of ventilation, write for our book, "The Jamesway"; and ask for the free help of our service men who have had so much practical experience in solving ventilation and other barn problems.

Jamesway
Complete System of
Ventilation

Will take foul air and moisture out, and bring fresh air in.

The Complete System includes Jamesway Fresh Air Registers Jamesway insulated Metal Outtake Flues, and James Ventilators.

The Jamesway Ventilation Department will help you solve your ventilating problems. For full information regarding Jamesway Ventilation, address Ventilation Department. JAMES MFG. CO., Fort Atkinson, Wis.

JAMES
COMPLETE
Ventilating System

Makes use of the principles proven necessary by Prof. F. H. King of University of Wisconsin, together with improvements developed by Mr. James and associates.

Work-Saving Devices

This book also describes many James devices that save labor, increase milk yields, help sanitation and improve cow health, such as Cow, Calf and Bull Pens, Feed Mangers, Calf Pail Holders, Sure-Stop Swinging Post, Swinging Cranes, "Safety First" Bull Staff, Handy Milk Stools, etc.

Also equipment for the hog barn, horse barn and beef barn.

Easy Installation

It explains the easy way of putting up carriers, setting up stalls and pens and attaching drinking cups. It shows how skilled help is not required, because of the ingenious James Anchors and because the equipment is assembled at the factory.

Free Dairy Barn Book

This 320 page book—"The Jamesway"—tells all about James inventions that save so much of labor, prevent spread of disease, promote better cow health, protect against dangerous bulls, make simpler the care of calves and sick cows and increase milk yields.

It tells about James Barn Plan Service; the many James barn experts who are at your service—men who know what has been successful and what has not; what not to do as well as what to do in planning convenient, money-saving barns.

Their advice on barn planning, ventilation and other barn problems is free, with no charge for floor plans.

A postal card request will bring you the book postpaid. Send for it today. Ask for Jamesway No. 23.

James Mfg. Co., Ft. Atkinson, Wis., Elmira, N.Y., Minneapolis, Minn.

HOW CHOOSING THE RIGHT WOOD MAY DOUBLE THE SERVICE YOU GET FROM LUMBER

"I cannot conceive at this time of a greater service to more people than to put order and system into the marketing of lumber."

This was said recently by one of the great industrial men of America.

He spoke as a buyer and user of lumber—thinking of the needs of industrial America, the big construction plans and the great era of home-building ahead; of the fact that every building project involves the use of lumber wholly or in part; and that the question touches every farm, every business, every town and city in the land.

Wood is the natural building material of America, just as stone is of France and Italy.

It is a startling fact that the service value of the average purchase of lumber could be increased 100%, if the buyer chose the most practical wood for a given purpose.

Putting order and system into the lumber business means wood in its right place.

It means selecting the kind of wood best suited for a given use.

It means specifying the grade best adapted for the job.

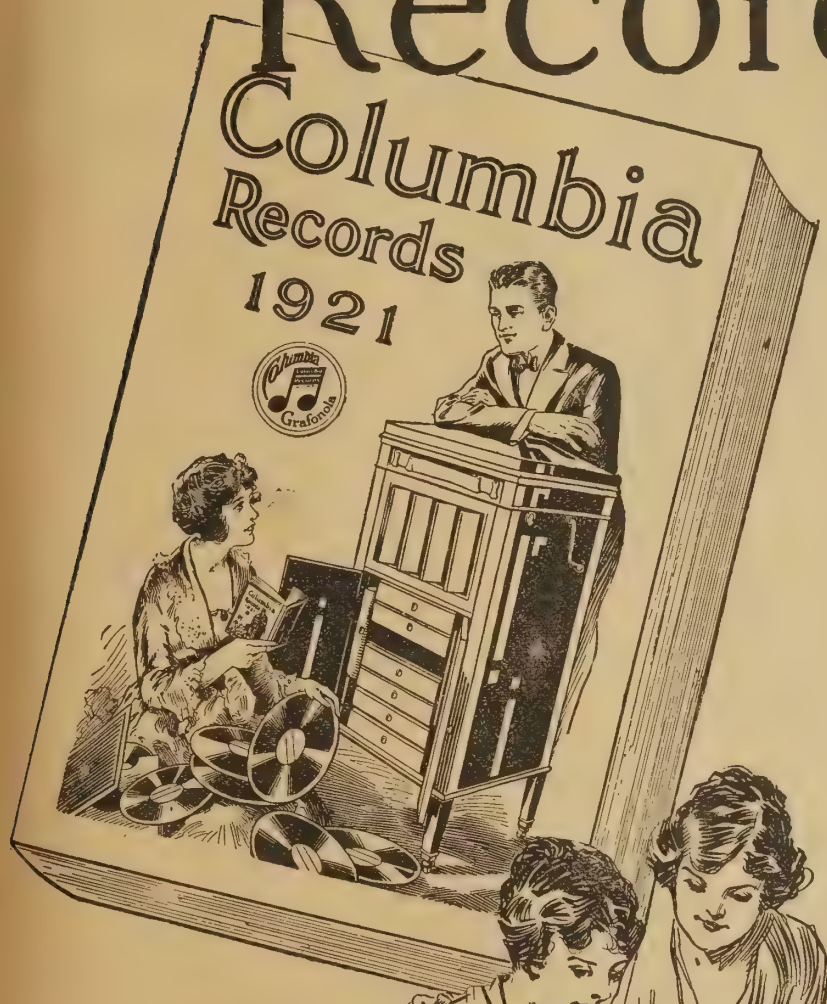
As substantial factors in the lumber business the Weyerhaeuser people wish to render real service to you and to everyone who uses lumber.

To this end we will supply to lumber dealers and to the public any desired information as to the qualities of different species and the best wood for a given purpose.

This service will be as broad and impartial as we know how to make it. We are not partisans of any particular species of wood. We advise the best lumber for the purpose, whether it is a kind we handle or not.

What we advocate is conservation and economy through the use of the right wood in its proper place.

If we could insure your getting the wood you ought to have, it might mean a difference of years in the life and service of the lumber—fifty years perhaps as against a few months. So important is the selection of the right wood or grade of wood for a given use.



From now on the Weyerhaeuser Forest Products trade-mark will be plainly stamped on their product. You can see it for yourself at the lumber yard or on the job after it is delivered.

When you buy lumber for any purpose, no matter how much or how little, you can look at the mark and know that you are getting a standard article of known merit.

WEYERHAEUSER FOREST PRODUCTS
SAINT PAUL · MINNESOTA

Producers of Douglas Fir, Western Hemlock, Washington Red Cedar and Cedar Shingles on the Pacific Coast; Idaho White Pine, Western Soft Pine, Red Fir and Larch in the Inland Empire; Northern White Pine and Norway Pine in the Lake States.

The New Columbia Record Catalog

The Latest News of the Newest Music

The new Columbia Record Catalog makes it easy for everyone to have the very latest music. Whether it's whistled or fiddled or sung, strummed on strings, blown on brass, or played on the pianoforte, the latest music is always yours upon the newest Columbia Records.

All the latest popular hits by the biggest, best-known headliners, all the old familiar melodies from home songs to the hymns you love, all this season's jolliest dances, band pieces, instrumental selections and all the time-defying classics are in the Columbia Catalog.

A limited complimentary edition of this new Columbia Catalog has been sent to all Columbia dealers for distribution without charge. Call or write for yours now while the supply still lasts. Then a look at this book and a note to your dealer will bring you any kind of music that you and your family want to hear.

New Columbia Records on sale at all Columbia dealers the 10th and 20th of every month.

Price Readjustments *and* Agriculture

Farmers today are sharing the national burden

IT is inevitable that present and future price readjustments should be felt by farmers as well as by all other industries. Yet men familiar with rural conditions know that decreases in income will bring many farmers dangerously close to failure. Means must be found to increase the farmer's earning power.

Greater production is one means to greater earnings. The ever-growing use of machinery shows that this fact is receiving careful thought. However, much can yet be done to lower operating costs. Particularly where machinery is used, operating costs very often eat heavily into profits.

In this connection, lubrication is the most important and often the most neglected factor. The way in which you lubricate your machinery is an important factor on whether it will have a long or short life; whether your repair bills will be large or small; whether your fuel expense will be high or low; and most important of all, whether your work will be interrupted by frequent breakdowns.

Prominent engineers agree that over 50% of all repairs on tractors, trucks and automobiles are due to incorrect lubrication. Thousands of public and private tests made by the government, agricultural colleges and manufacturers have shown that incorrect lubrication is often directly responsible for excessive fuel consumption, breakdowns and loss of power.

The Vacuum Oil Company has for years been recognized the world over as an authority on scientific lubrication. Gargoyle Mobiloils, when used as specified in our Chart of Recommendations, have in many tests, shown a saving of oil of from 50% to 70%, and a fuel economy from 17% to 25%. Gargoyle Mobiloils enable you to get more power from your engine.

The Chart of Recommendations (shown in part on this page) specifies exactly what grade of Gargoyle Mobiloils will give you best results from your automobile, truck or tractor.

* * *

Gargoyle Mobiloils are put up in 1-and 5-gallon sealed cans, in 15-, 30- and 55-gallon steel drums, and in wood half-barrels and barrels.

Write for "Correct Lubrication," a booklet containing complete automobile and tractor charts and other valuable data.

GARGOYLE

Mobiloils

A grade for each type of motor

In buying Gargoyle Mobiloils from your dealer, it is safest to purchase in original packages. Look for the red Gargoyle on the container.

VACUUM OIL COMPANY, New York, U. S. A.

Specialists in the manufacture of high-grade lubricants for every class of machinery. Obtainable everywhere in the world.

DOMESTIC BRANCHES:	New York	Philadelphia	Detroit	Minneapolis	Kansas City, Kan.
	Boston	Pittsburgh	Chicago	Indianapolis	Des Moines

Chart of Recommendations *for* TRACTORS

(Abbreviated Edition)

How to Read the Chart

THE correct grades of Gargoyle Mobiloils for tractor engine lubrication are specified in the Chart below.

A means Gargoyle Mobiloil "A";
B means Gargoyle Mobiloil "B"
BB means Gargoyle Mobiloil "BB"
Arc means Gargoyle Mobiloil Arctic

These recommendations cover all models of tractors unless otherwise specified.

Where different grades of Gargoyle Mobiloils are recommended for summer and winter use, the winter recommendations should be followed during the entire period when freezing temperatures may be experienced.

This Chart is compiled by the Vacuum Oil Company's Board of Automotive Engineers, and constitutes a scientific guide to Correct Tractor Lubrication.

If your tractor is not listed in this partial chart, consult the Chart of Recommendations at your dealer's, or send for booklet, "Correct Lubrication for Tractors," which lists the Correct Grades for *all* Tractors.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LX | FORT ATKINSON, WIS., JANUARY 14, 1921 | Number 26

HOW A CHAMPION WAS RAISED

Discussion of Calf Feeding

E. G. WOODWARD, State College of Washington

CHINOOK Segis Pontiac David, the junior champion Holstein bull calf at the Pacific International Live Stock Exposition, was bred and exhibited by the State College of Washington. After the show, this calf was sold at auction to C. A. Harrison of Seattle, who now describes him as the best individual bull calf in America.

At birth "Davy" was included in an investigation in which different methods of raising calves were compared. He weighed an even hundred pounds at birth and was assigned to the skimmilk group of calves, which meant that he was to be raised on skimmilk according to the best practices known.

"Davy" was allowed to remain with his mother for a part of his first day until he had nursed and until his mother had cleaned. He was then removed to an individual pen, 4 by 6 feet in size, which was boarded up solid on three sides to a height of three and one-half feet to keep him from associating with his neighbors, and with an ordinary slat gate in the front to allow ventilation and so that he might see out.

For the first few days he was fed whole milk from his mother, and later was given mixed whole milk from the herd. He received only whole milk for fourteen days, and during this time drank 112 pounds of milk, an average of 8 pounds a day, and made a gain of 17 pounds in weight.

During the third week of his life, a gradual change was made from whole milk to skimmilk, until at the age of 20 days he was receiving no whole milk. During these six days he received thirty-five pounds of whole milk and twenty-six pounds of skim. During this week he also began to eat a grain mixture of equal parts, by weight, of bran, ground oats, rolled barley, and linseed oil meal, which was kept before him in a feed box. During this week of change, he gained an average of .8 of a pound a day in weight.

During the next ten days of his life "Davy" received 109 pounds skimmilk, 9.4 pounds grain, and began for the first time to eat alfalfa hay in earnest, although he had nibbled at the hay which was kept before him previous to that time. In this ten-day period he gained an average of a pound a day.

"Davy" was then thirty days old, and from that time on his weight as well as his appetite grew steadily. Accurate records of his feed and growth were kept until he was 184 days old. He was gradually weaned during the last few days of this period. A study of his record shows that at the age of one hundred days he was receiving 14 pounds of skimmilk a day, which is as much as he was fed at any time. At that age, he also ate approximately as much grain and hay as at any time up to the age of 184 days. At the age of one hundred days, he was eating approximately four pounds of grain a day and three pounds of hay.

The records further show that at the age of 184 days "Davy" weighed 426 pounds, which was a gain of 326 pounds, or an average of 1.7 pounds a day. He had also grown 10⅜ inches in height at shoulders. This growth was made with the following feed and cost:

Whole milk, 147 lbs. at $3.50 per cwt.	$ 5.14
Skimmilk, 1,915 lbs. at $1 per cwt.	19.15
Grain mixture, 601.8 lbs. at $3.55 per cwt.	21.36
Alfalfa hay, 405.4 lbs. at $30 per ton	6.08
Total cost	$51.73

Normal weight for a Holstein calf at the age of six months, as determined by the Missouri Experiment Station and reported in Circular 88 of that station, is 349 pounds, so that "Davy" was approximately 20 per cent above normal weight for his age.

CHINOOK SEGIS PONTIAC DAVID AND C. W. KRASSIN, THE STUDENT WHO RAISED THIS CALF

In addition to earning his way as he went through college, he paid his own fare to Chicago as a member of the Dairy Cattle Judging Team, borrowed money enough to buy two extra good Holstein cows at the recent Portland sale and took them home to his father's grade herd, and now has one on semi-official test.

Up to this time the calf had shown signs of sickness only twice. At the age of 19 days while the change from whole to skimmilk was being made, he had a mild attack of scours. This condition was met successfully by slightly reducing the milk fed for two feeds. This case of scours was attributed to feeding milk that was too warm.

At the age of nine weeks the calf became constipated and appeared sluggish and droopy. He was given a dose of four tablespoonfuls of castor oil and was allowed no feed for a day. On the third day he was back to normal. This constipation was thought to be due to a lack of exercise while the calf was eating a rather heavy grain feed.

After being weaned at the termination of the feeding trial it was decided to fit this calf for the show circuit, and he was consequently fed skimmilk again for a period of about a month before starting on the circuit. During this time he never received more than 16 pounds of skimmilk a day. While on the show circuit he received a small feed of whole milk twice a day as skimmilk was not available. During the show season his grain ration was also changed slightly and a small amount of molasses added. At the age of nine months this calf weighed 636 pounds, which is equivalent to an average gain of nearly two pounds a day from the time of birth.

"Davy" competed at four shows and made the following winnings: Spokane Interstate Fair, Grand Champion; Walla Walla Agricultural Fair, Junior Champion; Washington State Fair, Second in Class; Pacific International Live Stock Exposition, Junior Champion.

The excellent results in the feeding of this calf were probably due to the close observation of the following points:

1. Avoiding the overfeeding of milk while the calf was young.
2. Increasing the feed of skimmilk gradually.
3. Weighing out the exact amount of milk for each feed.
4. Keeping the calf separate from other calves while young to avoid the sucking habit.
5. Keeping water and salt before the calf at all times.
6. Feeding a good grain mixture and alfalfa hay up to the limit of the calf's appetite.
7. Keeping both stall and calf clean.
8. Keeping calf in well ventilated barn of moderate temperature.

The practices followed in raising this calf may be criticized in several ways:

1. This calf probably did not get sufficient exercise. Some of the calves kept in small pens in this investigation developed a stiffness of the legs which disappeared gradually when allowed exercise each day.
2. This calf was never on pasture. There is every reason to suppose that a good pasture and shade might have added to the thrift of the calf.
3. The calf received no silage, although it is considered good practice to feed silage in limited amounts to calves.

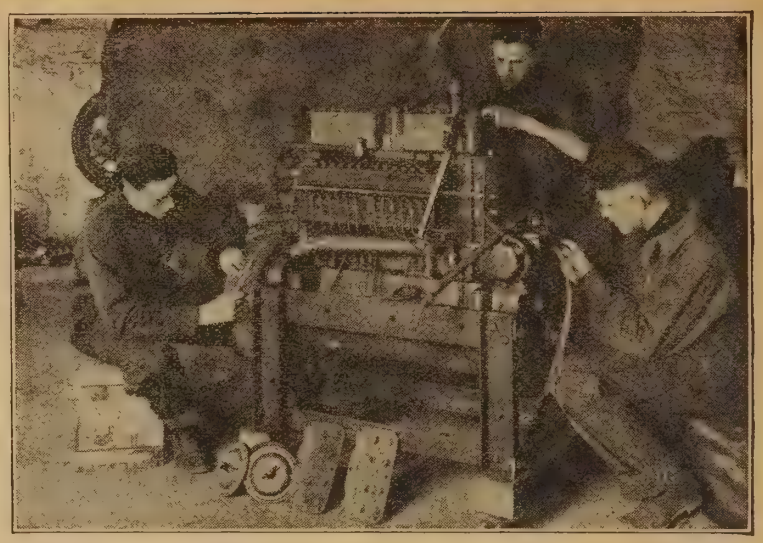
What Milk Lacks as a Beverage

HOARD'S DAIRYMAN:—I have read with very much interest the article in the December 3rd issue of Hoard's Dairyman, entitled "Advocating the Ad." The author makes some very enticing and appetizing suggestions for advertising, but the trouble is with the product to be advertised rather than the lack of ability to place the subject before the public.

She talks about picturing the wholesomeness of the noon-day lunch that may be but a crusty roll spread with sweet country butter, and a schooner of milk fresh from the clover fields. The trouble is that while she might advertise a schooner of milk fresh from the clover fields, the businessman is not able to procure it, and one of the first principles of business advertising is that we must be able to furnish a product that will live up to the advertising. The only thing a business man can get now-a-days in a city is a schooner of milk that is two or three days away from the clover fields, that has been standardized and pasteurized, and more often than not is on the verge of turning sour.

I have no doubt whatever but that she could advertise in a way to make the city man long for the products of the dairy, but she must first see that he can get these products when he wants them before stimulating his desires. One big reason why milk is not more freely consumed as milk, is that it is not palatable and inviting.

SUBSCRIBER.



Lubricating Tractor in Cold Weather

R. U. BLASINGAME, Pennsylvania College of Agriculture

MOST of the fuel, lubricating oil, and various grades of grease used by the farmer at the present time in the automobile, truck, and tractor come from the distillation of crude oil. When heat is applied to the still the lighter grades of gasoline are the first to be given off. At still higher temperatures the ordinary grade of gasoline is the next produced, followed by kerosene distillate and various grades of lubricating oil. Thus we see that in the distillation of petroleum the products which follow each other are more dense, thus requiring a higher heat to cause them to vaporize and cause them to pass from the still.

As a general rule the instruction books which come with the tractor say that the thick grades of oil should be used in summer and the thin grades should be used in winter. There is a very definite reason for this, owing to the fact that when the temperature drops to zero or below a thick oil in the crank case of the tractor engine may become solid or congealed. When the engine is operated in extremely cold weather and the lubricating oil is solid, the pump will fail to deliver the oil to the various bearings of the engine until the engine is warm enough to heat the oil to a point that it will be reduced to fluid form. During the intervening time the various moving parts and bearings of the tractor motor may become dry and burned and will have to be repaired. If the grade of oil is used which will not solidify, the lubricating pump will function properly and the motor will not be damaged.

Every substantial, well known, and well advertised oil company maintains a staff of engineers to test the various tractor motors as they come on the market to determine which oil is best suited to that engine in the various seasons. This procedure costs the oil companies quite a lot of money, and the farmer should take advantage of the results which they obtain. After the tractor motor has been tested with the various grades of oil, the engineers make up a lubricating chart in which they recommend for particular tractors certain grades of oil for winter and summer. It was noticed in the beginning of this discussion that there are various grades of oils which come from the still at various temperatures. Those oils which come from the still first are thinner and thus congeal at a lower temperature than the thicker grades of oil.

SHOWING LUBRICATOR SIDE OF A TRACTOR ENGINE. IT IS EVIDENT THAT A HEAVY OIL WOULD NOT FEED WELL THROUGH THESE PIPES IN COLD WEATHER

By writing to the various well-known oil companies one can receive very excellent literature on the matter of tractor lubrication; also on request one may receive a lubricating chart which shows the various tractors, trucks, and automobiles and the different grades of oil which are recommended for use in various seasons of the year. This literature may be had for the asking.

There are various systems of lu-

(Continued on page 1147)

IN THE OLD DOMINION STATE

S. R. WINTERS, WASHINGTON, D. C.

THE Fairfax County Cow Testing Association of Virginia, having the supervision of 522 cows, has retained the services of Miss Olive McEvally of Herndon as the first woman to be employed in the capacity of official cow tester in the Old Dominion State. The exigency of the World War afforded opportunities for women to weigh feed, analyze milk, and instruct farmers in the details of dairy management. The war once over, however, the difficult assignments given women as testers reverted to men who by training and experience are better qualified for the jobs.

The satisfactory service rendered by Miss McEvally, justifying her retention for another twelve months, emphasizes the possibilities and accomplishments of a woman in this singular capacity. She was raised on a farm in Virginia, where she spent all of her life except brief periods in which she was a student in schools not located in the community. Her early schooling was obtained in the rural schools, later supplemented by a course in home economics at the Harrisonburg Normal School. By special training she was equipped for her present job by pursuing a course for cow testers at the Blacksburg Agricultural College, which is to be further amplified this winter by a short course at the Virginia College. The expenses incurred are to be borne by popular subscriptions from farmers who have heretofore shared the benefits of her services.

The benefits accruing from the eight cow testing associations in Virginia are applicable in a relative degree to the organization of which Miss McEvally is official tester, the Fairfax County Association being the largest in the state. The average dairy cow in Virginia produces 4,000 pounds of milk and 150 pounds of butterfat a year. The cow testing records, as recently tabulated by the Dairy Division of the United States Department of Agriculture, indicate an average milk production of 5,670 pounds and a butterfat yield of 250 pounds. There is a 40 per cent difference favoring the animal whose productive capacity is observed by the cow testing association.

Miss McEvally is a farmerette both by previous training and inclination. When her brother went to France as a soldier, she donned his old clothes, went into the fields, and took his place as a worker in tilling the soil and harvesting crops. She is now in charge of the Fairfax County Association, her duties involving the weighing and testing of the milk of 522 cows, maintaining a record of the grain fed each animal, and keeping of the books of the organization. As she travels from farm to farm not infrequently does Miss McEvally lend a helping hand in driving a tractor, milking the cows, and washing the dishes. The performance of these chores invites co-operation from farmers in her work of determining the quantity of feed given in accordance with the known milk production, with the ultimate purpose of discarding the low producing cow.

MISS OLIVE McEVALLY, THE WOMAN TESTER OF VIRGINIA, AND THE HERD WITH WHICH SHE GAINED HER PRACTICAL EXPERIENCE

OHIO'S PLANS FOR THE FUTURE

CLARENCE M. BAKER, OHIO

OHIO'S leaders in agriculture are laying the foundation to cope with the future. To be sure the foundation is laid upon rock and not upon the sand, every effort is being extended to complete, to co-operate, and to finance agricultural affairs in such a way that there can be no slip in the cogs that control the destinies of the farmers. Such facts were brought out at a recent meeting of county agents and agricultural workers at the Ohio State University, Columbus.

Basis of Organization

Farm bureau work has gone forward to such an extent that praticalIy all the counties of Ohio have agents and are ready to organize for financing campaigns so that farm bureau work and county agent co-operation can be stauncher than ever. Agricultural advancement from the farm bureau standpoint is going forward in Ohio on the basis of the smallest agricultural unit of community, which in most cases involves a township. The county agent organizes these communities according to the type of farming and desires determined by the people themselves. The community forms a unit, having representation on a county board. The county board as far as possible determines the policies of the county and handles their relation to the state farm bureau federation.

In Ohio the grange has been active for almost fifty years and represents in most places the dominant feature of community social life. In some cases the Grange has looked after the financial interests of the farmer, but it is regarded that the farm bureau will do most of this in the future and that the grange will still function in its most important office —that of social and educational affairs.

L. J. Taber, master of the state grange, pointed out that "competition cannot keep two organizations going with the same people. With proper division of work the best results will be obtained. There is nothing so important to rural life as the proper division of labor and co-operation. The interest of the rural people will be the interest of America."

Ideals Sought by Ohio Farmers

Dean Vivian of the College of Agriculture pointed out that Ohio will not suffer severely from entering an era of fallen prices because of the organizations that have been perfected among agents. In Ohio there is a system of regional agriculture, in which the selling organizations are much more important than the buying, for the average Ohio farmer sells five times more products than he buys. Dean Vivian characterized the financial situation by stating that if the banks did not serve the farmer properly, the farmers would operate banks of their own. Furthermore, it is necessary in preparing for the future to organize in such a manner that it will be possible to increase incomes to the producer without increasing excessively to the consumer. Dean Vivian has passed the 30-year mark of agricultural work and feels that he is just beginning to realize what the vision of the future means.

Alva Agee, of the Department of Agriculture of New Jersey, believes that the next few years will determine the policies of American agriculture and that the foundation and pillars for this work must be laid deep and firm. There is a danger at present, he states, of class consciousness which may ruin the advancement of agriculture. The idea that one class can control the price and the distribution of food will work a detriment, but if this class operates with the idea of service to all interests of the country and the welfare of America, then the foundation will have been laid on a rock.

How the Farm Bureau Helps

The operation of farm bureau work in Ohio is somewhat regional. In the western half of the state the work is divided mainly into crops, live stock, and various organizations, while in the hilly sections, good roads, better schools, and community life are developed; but in all sections the farm bureau fosters the smaller organizations, standing back of associations like the wool growers, live stock, and shipping organizations.

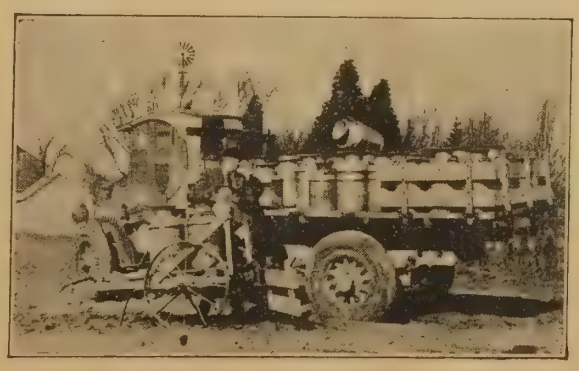
For instance, in a central Ohio county, a business agent for the farm bureau was able to keep out low grade, inferior fertilizers and bring in 1,500 tons of good fertilizers through the work of the co-operative elevators and buying associations. The agent himself did no buying nor selling—simply acted as a co-operator with the organizations already present.

Another county business agent handled almost $10,000 worth of products in a short time for farmers, at a saving of approximately 30 per cent. This business agent received orders from local communities for dairy feeds and pooled all orders for the county, but used local elevators and merchants as distributors, returning to them almost as much profit as they generally make, but handling material in larger bulk with more service to farmers. For instance, linseed meal was selling for $90 a ton in one section, but by pooling and placing the orders, it was possible to furnish it to the farmers at a cost of $70 a ton without interfering with the business of local concerns. Through this co-operative effort, storages were used.

Shipping and Buying Organizations

In all this work there is an attempt to make the bank the logical credit center, arrangements being made with banks to take over notes that are given for goods at co-operative elevators. Thus the problem of waning finance is passed on to the proper community institution for handling and loaning money.

Interest in Ohio is being centered on live stock shipping associations. Through shipping and grading of hogs it has been possible to secure Chicago prices at some Ohio markets with no commission charges or loss from shrinkage. The live stock shipping associations generally bear an intimate relation to the farm bureau, as $1 from the $10-farm-bureau-membership fee in Ohio pays for one share in the live stock shipping organization. The live stock organizations are mainly a selling agency, composed of a board of directors that employ a manager. This organization sells stock. They have been able to eliminate ungraded live stock, the common live stock "fill", and to eliminate shrinkage charge on live stock delivered in trucks to markets. For some reason in some localities live stock delivered in truck had been docked as much as 50 cents per cwt. Better railroad rates were secured in some cases.



In one county it was found that 325 fertilizer agents were operating. Through work of the business agent this was reduced to 25 doing the same service and saving the farmers money. There was a saving of $15,000 in freight charges in one instance by pooling all business for freight rates.

Home Making Considered

The development of the business end of farming, however, will not be the only thing that will be considered in Ohio. The profession of home making will undoubtedly be given equal consideration and a little glimpse of the future shows what is coming in that line. The Ohio farm woman, it has been found through surveys, has a 12-hour day. Only 9 per cent of country people in Ohio have running water in the kitchen and 80 per cent still burn kerosene lamps. The average distance that farm women carry drinking water for the home is 67 feet and soft water, 24 feet. This shows what problems home demonstrators have to work with in counties and these women agents are beginning to be looked upon as super-agents.

The Corn Song

HOARD'S DAIRYMAN:—I know that Homer sometimes nods, but I am amazed that the editorial staff of Hoard's is so little versed in the works of the farmer-poet, John G. Whittier, that it prints the Corn Song and ascribes it to an unknown author! Not only that, but four of the best verses are left out.

Wish I had time to write you a dissertation on why every farmer should read Whittier's poems. There have been many so-called "farmer-poets", but to my mind Whittier was supreme among them all. A volume of his verse ought to stand on every farm table along with the Bible. Nothing equals it in homely philosophy and love of simple farm life. You might well reprint parts of the following poems: The Huskers, The Drovers, Maud Muller, The Barefoot Boy, and Among the Hills. No lover of farm life ought to let the winter pass without rereading Snow Bound, My Psalm, and The Eternal Goodness, the finest examples of simple faith and trust ever penned in any language.

Pardon my somewhat lengthy discourse on one of the "humbler poets", but I have always felt that good poetry is a great inspiration to anyone, and Whittier speaks the language of the "plain people". A dip into his works is refreshing in these times of radicalism and unrest.

ERNEST KELLY.

[Editor's Note:—We plead guilty to the impeachment, but are glad to be classed with Homer, the gifted poet of the Grecian Golden Age, whose Iliad and Odyssey have been the bete noir of the classical school boy of every age and the delight of those who could read in translation the heroic deeds of Achilles and the enthralling story of the wanderings of Ulysses.

We, too, have admired the Quaker poet and can confirm all that Mr. Kelley says. We regret the oversight, but are happy to have made it in finding that Hoard's Dairyman is so well read and that other men and women are lovers of the kindly author of The Huskers, The Barefoot Boy, and Snowbound. To the readers who have written us and to those who sent music to which the poem is sung, we send on our thanks and greetings.]

SUPPLYING A LARGE CITY WITH BUTTER

W. B. LIVERANCE, NEW YORK

GREATER New York, consisting of the boroughs of Manhattan, Brooklyn, Queens, Richmond, and the Bronx, has a population of about six million people. In addition, it would be safe to estimate a permanent transient population in the city of about a half million. Adjacent to New York, there are hundreds of cities and smaller towns which draw their food supplies in great part from New York. It is very probable that the aggregate population of such cities and towns is fully three million people. New York then is the receiving and distributing point of food products, to say nothing of various other products, for a population approaching ten million people. The immensity of the marketing machinery necessary to efficiently supply such an aggregation of human beings is beyond the comprehension of the individual who gives the matter but superficial thought. It might seem that the distribution of products of various kinds to such a throng might result in considerable confusion. However, unless there is some unnatural agency in operation, the delivery of food in a big city for several days is a factor whose significance is thoroughly appreciated. The stocks of food which are held in warehouses from day to day, while relatively large, are comparatively small when the consumption of food per day in a large city is given consideration. Failure to deliver entire fresh stock every ten days would practically cause the city to face starvation. An urban population thoroughly appreciates the value of well operated thriving railroads to the country as it is entirely at the mercy of the public carrier.

As compared to bulkier food products, the volume of butter that is consumed in a large city is small. On the table it occupies a very small space when compared to bread, meat, and potatoes. However, in the aggregate the quantity consumed in and about the city in the course of a year assumes considerable proportions, and the value in round numbers expressed on paper is stupendous. Let us suppose that the average per capita consumption of butter of the ten million people in the vicinity of New York is only one-fourth pound per week. That would mean a consumption of 130 million pounds, or 65 thousand tons, of butter per year. That is without doubt a low estimate. It is safe to say that fully 200 tons of butter are consumed in the vicinity of New York each day. In other words, practically 60 thousand tubs of butter are demanded each day of the year by New York City. The distribution of such a vast quantity of any one product would require the assistance of many traffic experts if it were necessary to work out a system of distribution in a very short time. However, that is not necessary as the marketing machinery that now operates is the result of many years of development. It works very efficiently although to the uninitiated, and even to those familiar with its operation, it sometimes appears to cause much duplication of effort.

There are three classes of merchants in the city who act as agents in distributing butter after it arrives in the city. They are the wholesaler, the jobber, and the retailer. The wholesaler receives the butter direct from the producer and handles it in very large quantities. He usually sells direct to the jobber. Oftentimes, he conducts a jobbing business in conjunction with his wholesale operation. His commission on the individual unit of butter, the pound, is relatively small as he figures on a large volume of business and a quick turnover. As the quantities of butter which he handles are large and quickly amount in value to large sums of money, his one great concern is to find reliable jobbers with whom to deal. The credit end of the wholesale butter business is very important. The wholesaler must depend to a great degree on the judgment of his salesmen as to whether or not an account is safe. The salesmen usually remain in the store during the day but frequently call on jobbers in an effort to develop new business. Practically all the butter is sold in the store, however, after the prospective buyer has inspected it to determine whether or not it will conform to the requirements of his trade. The wholesaler receives the greater part of his butter on consignment and he remits to the shipper all the money that is received from the sale of the butter minus the commission and transportation charges. The wholesaler is entirely responsible for collecting money derived from the sale of butter and he must make remittance to the shipper regardless of whether or not he is able to make collection from the individual to whom the butter is sold. The progressive wholesaler very seldom allows bills to remain uncollected longer than ten days.

The jobber disposes of his butter to the retailer. Necessarily, he must sell the butter in smaller quantities than the wholesaler. It is a custom of the trade that retailers be granted longer credit than jobber. As the usual time of collection is from 30 to 60 days, the jobber at times has huge sums of money tied up. However, the jobber has his compensation in that his commission usually amounts to two or three times that of the wholesaler. The jobber runs a greater risk in making collections as he deals with a multitude of small business men, many of whom have very little financial backing. It is not uncommon to hear reports that a jobber has lost considerable money through a poor account. The retailer receives his butter in whatever form he desires. He may get it in the original package, in bulk packages of various sizes, or in prints. The jobber is at a considerable expense in operating his business as he must employ traveling salesmen to dispose of the butter, he must have employees to print and otherwise prepare the butter for his market, he must have delivery equipment as he delivers the butter to his customers, and his office force must be larger than that of the wholesaler as he has a multitude of accounts with a resultant volume of clerical work.

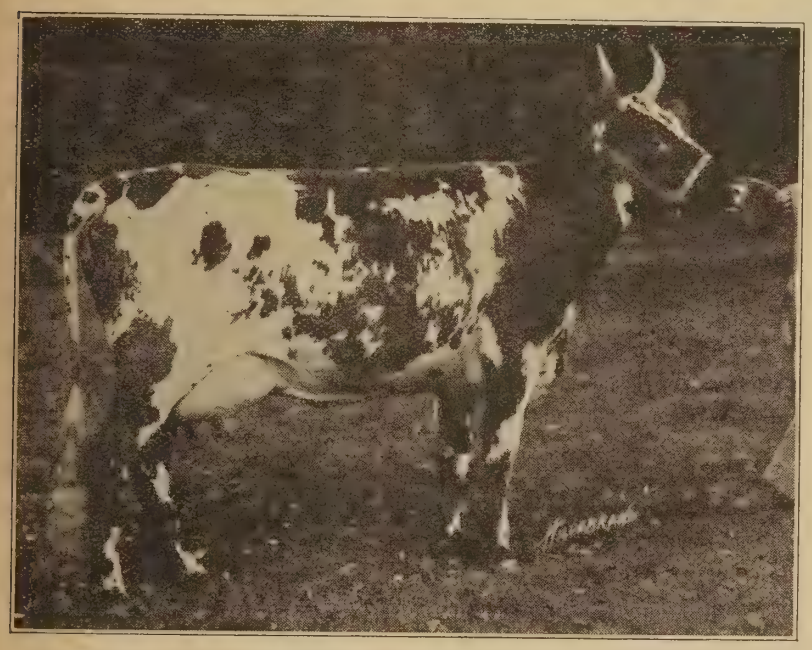
To the retailer, butter is only one of many products which he sells. However, he is put to considerable expense in preparing to handle it as he must install a refrigerator. There is also considerable waste if the butter is sold in bulk form, that is, direct from the tub, as the greater percentage of all butter is sold, as there is of necessity a

INTERIOR OF "COOLER" OR REFRIGERATOR OF A LARGE WHOLESALE BUTTER HOUSE

TYPICAL BUILDINGS IN THE WHOLESALE BUTTER SECTION

When one becomes more or less familiar with the distribution of food products in a great city he becomes greatly impressed with the necessity for efficient service on part of transportation agencies which carry the products from the producer thence from one distributing factor to another. Not only must railroads be operating efficiently but local carriers must also be doing their part. The butter receiver, as well as the general public, was caused to realize as never before the importance of proper transportation during the strike that prevailed on practically all railroads in the early spring. It was then that the large city found itself facing a shortage of all food products and there was ample excuse for the pessimistic feeling that prevailed throughout the country and especially in the large centres of population at that time. Food products must be kept moving at all times if the population is to be served as it should be. Any agency that halts

ONE OF THE WHARVES ON NORTH RIVER WHERE GREAT QUANTITIES OF BUTTER ARE UNLOADED AFTER HAVING BEEN FERRIED ACROSS FROM THE JERSEY SIDE

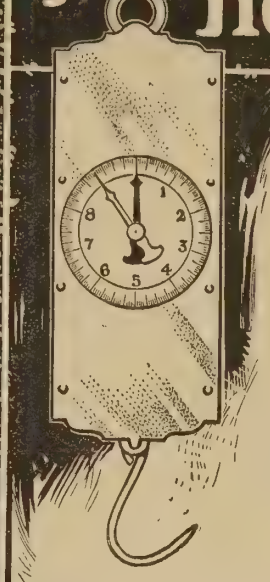


considerable loss in moisture and small scraps. The retailer's profit is larger than that of either the wholesaler or jobber, in fact it is larger than the two combined. It is he who is in direct contact with the consumer and therefore he is a very important agent in the scheme of butter distribution.

It is unquestionably somewhat unfair to both the producer and consumer of butter that there should be so many middlemen between them. However, it is a condition that as a whole can not be avoided. Theoretically, it would be ideal for the consumer to buy his butter direct from the producer, thereby eliminating the profits that go to the wholesaler, the jobber, and the retailer. Practically, such a method is impossible as the factors of preparing shipments for individuals, the making of collections, the furnishing of refrigeration for long distance shipment of small quantities, and the solicitation of business at long distances are barriers that can not be eliminated. The present arrangement, while far from ideal, makes for quick and economic disposal of butter as soon as it arrives. However, it can not be denied that one shipment of butter is oftentimes juggled from one wholesaler to another, possibly several times, before it passes on to the jobber and ultimately to the consumer. That is a condition which prevails in all lines of goods which are placed on the open market and it is very probable that there is less manipulation in the butter market than in any other. Eventually some scheme of distribution may be worked out that will be a great improvement on the present one. It is very doubtful, however, if there will be any radical change of method in the near future.

The wholesale butter market of New York City is located at the lower end of the island of Manhattan, near North River, the stream of water which flows between the island and the state of New Jersey. All the butter destined for New York is delivered by railroads to points as near that district as possible. The New York Central Railroad has a terminus, St. John's Park Station, which is in the heart of the butter market. All butter over that line is delivered to that station. The terminals of all other lines from the West are on the New Jersey side. Butter arriving on those lines is transferred by ferry to wharves on the New York side near the market from whence it is delivered to stores by truck. At the stores, the butter is prepared for ultimate disposal. If the containers have become broken to some extent in transit, they are thoroughly coopered. If the butter is moldy or dirty, each tub is scraped to remove all foreign matter and if necessary the tubs are re-lined with fresh parchment. The butter is then weighted and the net weight of the individual container is marked on the tub, or whatever package may have been used. Those weights constitute the basis of weight for which the shipper is paid, as well as that for which the buyer must pay.

It undoubtedly would be advisable to describe briefly how the market quotation is established each day. The organization of butter, cheese, and egg dealers, which in the butter market corresponds to the Stock Exchange in the money market, is the New York Mercantile Exchange. The 'Change, so-called, meets every business day at 10 o'clock where stocks of butter are bought and sold. Transactions on 'Change indicate the trend of the market for the day. If receipts are high and demand somewhat low, the price tendency is usually downward. If the opposite is true the tendency is in the opposite direction. However, each day shows individual characteristics which affect the market for the day. The price is not entirely governed by the transactions on the 'Change. The market reporter visits many of the leading wholesale stores in order to determine the activity of the market and to check up on the Exchange transactions to satisfy himself that they were correct indicators of the market trend for the day. He then, arbitrarily, uses his judgment in fixing the quotations.



The subject has scarcely been touched. A volume could be written on the subject and yet much would be left unsaid. There is no question but that in many instances too many commissions are made on a single shipment of butter. That is unjust to the producer and consumer. However, business men throughout the country in the chase for the elusive dollar do not stop to consider the finer ethical points of the game. The practice of manipulating sales so that more than one profit is made is considered honorable and is generally practiced. Many of us are not as yet so calloused but that some of the practices seem to be on the border between legitimate and dishonest business. Until some better scheme is developed, it is very probable the present method of marketing butter will continue in vogue.

LUCY WEBB, AYRSHIRE COW OWNED BY MIDDLESEX EADOWS FARMS, MASSACHUSETTS

As a junior two-year-old she has produced 13,510 lbs. milk, 583 lbs. fat.

Yield of Each Cow Figured for You

By the *CP* Pail Balancing Scale

Has two indicators. Weighs the milk in the pail. Eliminates errors. First hang the empty pail on the scale. Turn the thumbscrew in the center of the dial, which moves the red indicator until it is at the 0 mark, thus balancing the weight of the pail. Then add the milk or cream and the result shown by the red indicator gives the net weight of the milk or cream, and at the same time the black indicator gives the gross weight of pail and milk.

The capacity of these scales is 30, 60 and 120 pounds, according to size, in pounds and tenths of pounds. With each scale we furnish special blanks that will contain the record for two milkings a day for one week for 14 cows.

The scale can also be used for all weighing purposes.

Price each, 30 lbs. capacity by 1-20 lb. $4.85, 60-lb. $6.65, 120-lb. $8.85. Extra records per dozen, 15c.

Price each Postpaid (East of the Rockies) 4.85

Silage Corn a Good Nurse Crop For Alfalfa

JOHN B. ABBOTT, VERMONT

ALFALFA hay and corn silage constitute about the best possible roughage basis of an economical and otherwise desirable dairy ration. Given such roughage the dairyman needs little or no concentrates for low and medium producing cows. The higher producers will pay for what concentrates their extra production necessitates anyway and handling them at a profit is no such problem as is handling the average dairy herd.

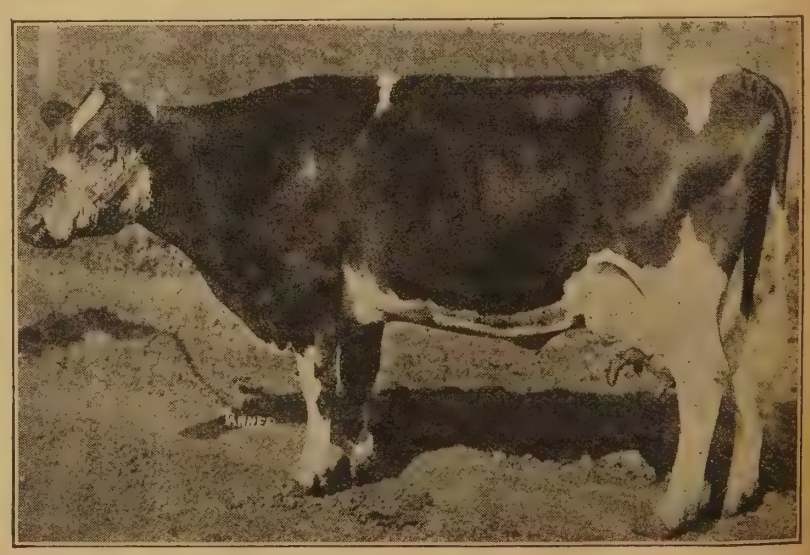
The combination of corn silage and alfalfa hay is so good, not only on paper but in the test of actual practice, that it seems peculiar that alfalfa culture is not making faster progress in those dairy sections outside the region where alfalfa is the principal hay crop.

Why is it? If alfalfa is such a desirable supplement to corn silage as it is claimed to be, if alfalfa adds so much fertility to the farm by way of nitrogen fixation, if alfalfa outyields nearly all other hay crops,—and alfalfa certainly does possess these advantages—and if alfalfa can be grown with success on so much land where it is not grown at present, as the county agents have demonstrated that it can be, why then does alfalfa culture spread so slowly?

Probably there are a number of contributory reasons but in my judgment one of the principal reasons is to be found in the fact that alfalfa culture has been made to appear to be both more expensive and more difficult than it really is. It is neither expensive nor difficult to secure a stand of alfalfa. It is not necessary to lose the use of the land for a whole season in spite of the fact that the most widely advocated method, mid-summer seeding without a nurse crop, involves such loss. Alfalfa seed costs no more per acre than the ordinary grass and clover mixtures, in fact not as much as the mixture which I use, and the amount of lime required is no more than ought to be used anyway for grass and clover. Inoculation involves only a negligible amount of time and expense.

I have established well over fifty demonstration fields of alfalfa on as many farms in four states during the past ten years and in all that time I have never secured a better stand, amount of seed considered, than I secured this summer on my own farm using silage corn as a nurse crop, nor have I ever secured a good stand so economically.

I was led to try silage corn as a nurse crop because I could not afford to lose the use of the land for a whole year as is usually the case with summer seeding without a nurse crop and I had no particular use for beardless barley, which is often recommended. I did have a very definite use for all the silage corn which I could grow.



The field selected for seeding had most of the desirable attributes for alfalfa culture. It slopes enough so that water never stands on any part of it. The soil is deep, well drained, in fact it is inclined to be drouthy, and free from ledges and hard-pan. The field was in timothy in 1918 and in silage corn last year, manured less heavily than might be wished but still enough to grow a good crop. It was cultivated thoroughly enough to kill the sod and to prevent any of the annual weeds making seed. I plowed it last fall, applied ground limestone at the rate of two tons per acre, and harrowed it over once with the disk so as to give the lime an opportunity to sweeten it more or less during the winter.

As soon as the ground was in condition to work in the spring I harrowed it with the disk and spring-tooth exactly as though I were preparing a seed bed for corn. Then, at irregular intervals as other work permitted—but often enough to kill weeds as fast as they started—I went over it with the smoothing harrow set to work about as shallow as possible. This treatment was continued until the latter part of June.

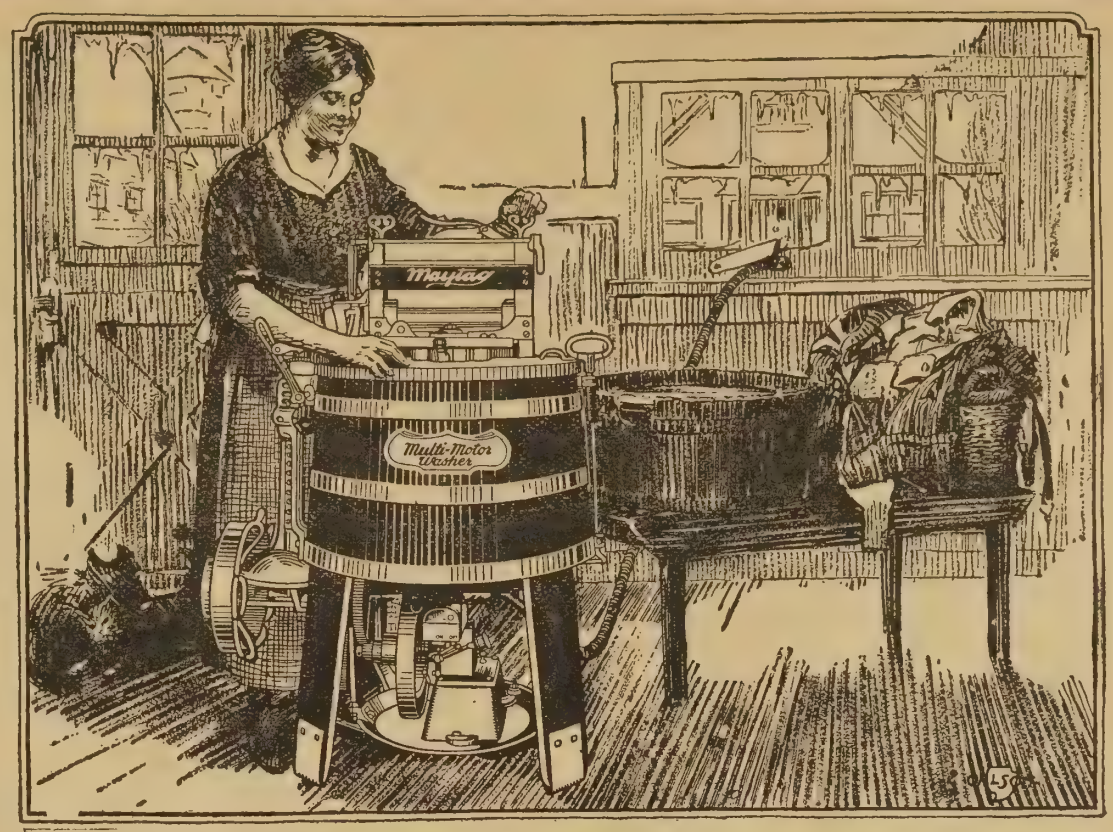
In the meantime I procured some Montana grown alfalfa seed, a few sticks of hard glue, and some soil from an old and well inoculated field of alfalfa.

With everything in readiness and rainy weather in prospect I took the one horse corn planter and planted rows of silage corn five to six feet apart over about two-thirds of the field. The balance I left without corn for comparison. Immediately after planting the corn I harrowed the field again with the smoothing harrow to destroy the planter tracks and prepare a fresh seed bed for the alfalfa. I then proceeded to inoculate the alfalfa seed, sow it and cover it by cross harrowing and rolling it in.

In order to inoculate the seed I dissolved a few sticks of the hard glue in warm water in a double boiler, barely moistened the seed with the glue solution, and then dusted it with the inoculating soil enough to dry up the glue and cover each seed with

BUFFALO PARTHENEA SKYLARK, HOLSTEIN COW WHICH IN ONE YEAR HAS PRODUCED 22,207.9 LBS. MILK, 844.14 LBS. FAT, FOR THE MINNESOTA HOLSTEIN COMPANY

dust. I may have used four or five pounds of inoculating soil and a quarter of a pound of glue for forty pounds of seed, certainly not more. I sifted the soil through a window screen to get rid of pebbles and trash. The whole process of inoculation did not consume more than fifteen minutes once the glue was dissolved.



The alfalfa came up before the corn did and both crops, thanks to the thoroughly prepared seed bed, grew amazingly. Cultivation of the corn was not possible, of course, nor was it necessary as the thorough surface cultivation through May and June had eliminated most of the weeds previous to planting.

By the twentieth of September the corn stood ten to twelve feet tall with ears in the hard roasting stage and the alfalfa was more than knee high and in bloom. New shoots at the crowns indicated the start of a second crop. About that time the corn was frosted so it was cut for the silo. Immediately afterward I set the mowing machine to cut about five inches high and cut and hayed the alfalfa. I am not at all certain that cutting the crop at so late a date is a safe practice for general recommendation in this latitude but in this particular case the crop was all done growing and the second crop starting. The five inch stubble left, together with the new growth, would seem to be adequate winter protection and the hay harvested, with hay worth $40 a ton, justified taking some risk.

November first, the field was green and well covered, having gone into the resting stage for the winter looking as good as midsummer seeding without a nurse crop and I am "to the good" by about five or six tons of good silage per acre.

It seems to me that this method of seeding is worthy of a trial by dairymen outside the alfalfa region. It is materially less expensive than midsummer seeding without a nurse crop and apparently just as effective. It gives the alfalfa a decidedly better chance than seeding in standing corn a month or more older than the alfalfa and planted standard distance between rows.

It does not render the use of lime and inoculation unnecessary or minimize the importance of suitable soil and eradication of weeds but it does minimize the importance of suitable soil and eradication of weeds but it does minimize the cost of securing a stand of this most desirable hay crop.

Use the Maytag Multi-Motor Indoors—
No Gas—No Smoke

In zero weather you can use the Maytag Multi-Motor Washer in the kitchen. Furthermore, you can work in perfectly clear air—because the Maytag has a long flexible metal exhaust hose which carries the exhaust gases outdoors.

Here again the wonderful Maytag Multi-Motor brings all the conveniences of the finest electric washer to homes not having electricity.

Why wash by hand? Why labor and rub, and work over the wash tub? This remarkable Maytag invention is operated by a wonderful little air-cooled gas engine—a part of the plant itself. It gives you a power washer which handles any kind of clothes. Put in your clothes, soap and hot water. Start the little motor—that's all. Then feed them through the three-way adjustable power wringer, and your wash is done.

Thousands are in use. More are ordered every day. You find delighted users everywhere. Have the local Maytag dealer demonstrate the machine. Costs little to buy and little to operate. See about it at once. If you do not know the local dealer, write us for his name.

For Homes With Electricity

For many years the Maytag Wood Tub Electric has been a tremendous favorite. It is the same in every respect as the Maytag Multi-Motor except that it is operated by a modern electric motor. Like the Multi-Motor, the Wood Tub Electric has a three-way adjustable power wringer. You merely feed the clothes through.

A Farm Account Book

Several hundred Badger farmers will use this year the new simplified farm account books issued by the College of Agriculture here. These books represent the result of efforts of the department of agricultural economies to develop a concise, simple, and adequate system of accounts for Wisconsin farmers.

"In farming as in other business any problem can be answered if enough facts relating to it are gotten together," said J. S. Donald, in charge of farm management demonstrations, in commenting upon the use of records and accounts on the farm. Farm account books take up only the really important aspects of the farm business. In this way a great deal of useful information is possible with the least possible work on the part of the farmer. Every business man likes to know how his expenses are being distributed, how each part of his business is progressing, and how the whole business is developing from year to year. Also, everybody likes to deal with a man who is certain of his statements—who has his business records and accounts in good shape. The fact that there is a distinct demand by Wisconsin farmers for a simple, easily handled farm account book shows how a great many farmers appreciate the value and the necessity of good businesslike records."

Wisconsin's new improved farm account book is distributed through individual requests, and through cooperating farmer agencies as the county agent and farmer organizations. A complete inventory of the farm equipment and capital is provided for in opening the book. Records of cash receipts and expenses are made throughout the year, and crop production records aid in checking up on all parts of the farm business as they occur. A balance can be taken at any time, and the whole record and summary makes it easy to use the same form of book from year to year, according to Mr. Donald. The only charge for the book is the cost price of fifty cents and it will be supplied by the Agricultural Economics Division, College of Agriculture, Madison, Wisconsin. With income tax laws in operation, accounts are considered to be a protection to the farmer. Many farmers without records of a great many incidental expenses such as repairs, and various items which are exempted, are obliged to make rough estimates of their taxable incomes which are very apt to be wrong—too high in many cases.

"Farm accounts," says Mr. Donald, "are also the foundation of a successful state marketing program. For instance, the State Division of Markets and other agencies which are trying to make a study of production and marketing problems with a view to aiding the farmers in these problems, need definite information which can only be supplied by farm accounts. Probably most farmers open their books at the beginning of each year, because at that time tax figures and other items are needed. On many farms, however, accounts are closed in March."—Wisconsin College of Agriculture.

Jersey Cattle Notes

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Include Butter in Tariff

On December 6 the Senate Finance Committee took up the demand for the inclusion of dairy products in the emergency tariff bill which had previously passed the house with duties assessed on wheat, onions, and twelve other items. W. F. Schilling of the Twin City Milk Producers' Association made the opening statement and other witnesses were heard on Monday, January 10. The rates sought are 10 cents a pound on butter, about the same on cheese, and other dairy items in the same ratio.

If there is to be tariff legislation at this session, it should not fail to include dairy products. Dairymen may well write or wire their senators urging them to use their influence in having an import duty on dairy products inserted in the emergency tariff bill. Even though the prospect may not be bright, as indicated on our editorial page, for the final passage of this tariff bill, a good showing at this time will be of assistance when the tariff bill of the next session is up for consideration.

Butter Market Advances

[Report by U. S. Bureau of Markets.]

Light receipts of fancy butter, a generally satisfactory holiday trade, and a regular good consumptive demand acted to keep butter markets in a firm condition during Christmas week. The small percentage of fancy quality in current receipts was barely sufficient to take care of the demand, and as a result prices showed a gradual advance. Top grades were so scarce that buyers were unable to supply their wants and turned to medium grades. This gave these grades also a firmer tone, but as yet little interest has been shown in lower scoring lots unless offered at very low prices.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending December 25, and the corresponding week of last year were as follows:

	Week ending Dec. 25 1920	1919
	Cents	Cents
New York	55.90	70.80
Chicago	52.90	65.60
Philadelphia	56.20	72.00
Boston	53.90	70.10
San Francisco	47.88	65.10

The receipts of butter at these markets for the week were 5,204,739 lbs. as compared with 5,873,885 lbs. a year ago and 5,549,940 lbs. last week

Cheese Market Inactive

[Report by U. S. Bureau of Markets.]

Inactivity continued to feature cheese markets during Christmas week. Buyers in all markets operated very cautiously and none were taking goods in excess of immediate trade requirements. There is a general desire to carry as light stocks as possible over the first of the year when inventories are usually taken and the larger accumulations are now held by first-hand receivers.

Basic asking prices on fresh cheese at country points in Wisconsin were about the same as the previous week, and actual sales in primary markets as well as distributing markets were made at prices practically unchanged. The market on held cheese, however, was not quite so firm as it has been for several weeks. In fact, wholesale prices at distributing markets were lower by about one-half cent toward the latter part of the week.

The average wholesale prices on American cheese style Twins for the week ending December 25, 1920, and for the corresponding week the previous year were as follows:

	Week ending Dec. 25 1920	1919
	Cents	Cents
New York	27.50	31.50
Chicago	22.50	30.89
Boston	24.50	31.50
San Francisco	26.10	27.95
Wisconsin boards	20.63	30.50

The receipts of American cheese for the week at the four markets first mentioned and at Philadelphia totaled 2,042,875 lbs. as compared with 2,535,045 lbs. a year ago and 2,770,366 lbs. last week.

Experiences of an A. R. Tester

HOARD'S DAIRYMAN:—Some people say to me: "You fellows must get a great experience traveling around from place to place." Yes, that is what I would call it, "a great experience". I would not trade it for the same amount of time in any school in the world.

As an Advanced Registry tester I meet with all kinds of people, on all kinds of farms, under all kinds of conditions. Perhaps my first stop made as good an impression upon my memory as any one since. It was at a large farm. I was most impressed by the farm manager. His congeniality, his promptness in all business, and his attitude toward fellow breeders assured that large breeding establishment of marked success. Men who came to buy did not see that farm only. They were shown first the home farm and then, if they showed any desire to buy but were not entirely pleased, they were shown around amongst the different fellow breeders. Invariably they travelled from farm to farm and returned to their former designation well impressed with the cattle of that breed. Usually they purchased from him who had so favorably impressed them from the start.

Again, I was at a place where everything seemed topsy turvy. Men were going and coming. I sat at a table with thirty men and could find but two who were on the farm over eight months, although this was an old established farm. The farm manager was a city man. Coming to the office at 10, he left at 4, giving him ample time to show what he knew.

One day last March I was riding on the trolley, inquiring my way to a certain place. A long bearded Dutchman explained he knew the place well. "Young man, you will see a great place. He has 'pedigree' cattle. You'll find last year's manure, this year's crops, the cattle, horses, chickens, and pigs all under one roof." The old gentleman's disgust was apparent. I was in one of the best agricultural communities of the United States. The old man had pride in his community and showed utter disgust for such a "ranch". When I arrived I found all I had expected and considerable to boot. This man, otherwise an ordinary farmer but a pedigree fanatic, tried to run the place on advertising. I am safe in saying very few ever bought of him, after they had seen his farm. Many of the farmers in that community were disgusted with "pedigree" stock. They had seen his ads and had visited his place. If this was an example of such stock, they didn't want any. Such places are rare but they do much harm among farmers who would like to better their stock by pure-bred sires.

Often I am asked if this high priced stuff is a rich man's hobby. I answer that rich men have different hobbies. Is it a discredit to the pure-bred business that they pay big prices and then lose out? A man will fail in any business if he does not know how to run it. Some rich men fail at it but I have seen very few poor men but what prosper through breeding and A. R. testing. We find among the directors of our different breed associations many men who are far from being rich.

Some people nurture the idea that most pedigree records are crooked. That is a grave mistake. The publicity of a few crooked records has given some that impression. I have seen cows make a thousand pounds of fat just as easily as others made 600 lbs. It is surprising how much the different herdsmen know about the work of each other. This is likewise true among the different breeders. Anyone expecting to do business in the breeding line had best walk straight.

I have noted many small things during my year of testing. Many of these experiences have cost others heavily, have caused the failure of some, and are consequently priceless in value. I feel I have some practical ideas as well as technical ones. I am interested in the pure-bred business far more than when I started and, to others contemplating a course along this same line of business, I can highly recommen l a little A. R. work.

Pennsylvania. W. R. ROONEY.

Feed Market Dull

[Report by U. S. Bureau of Markets.]

The feed market during the week ending December 25 displayed very little activity.

A somewhat better interest was manifested in cottonseed meal and middlings. The latter feed is now selling from $3 to $4 per ton lower than bran, while only 3 months ago it was quoted about $10 per ton higher than bran. Cottonseed meal was bought because of its relative cheapness; 1 pound of good quality meal being usually considered equal to 2 pounds of bran for milk production, while the prices for these commodities are about on a par in several markets, which fact explains the present light consumption of bran.

Pure wheat bran was offered at $1.50 less per ton than last week in Minneapolis, quotations ranging from $25.50 at that point to $30.50 in Chicago and $36 in the East. Middlings ranged from $2 to $4 under these prices in the various markets.

Cottonseed meal (41%) was quoted at $34 in Kansas City, $36 in Chicago and Minneapolis, $30 in Memphis, $41 in San Francisco, and $39 in the East. Linseed meal ranged from $40 in Omaha and Minneapolis to $42 in Chicago and $45 in the East. Peanut meal (36% protein) was quoted at $36 in Richmond.

Alfalfa meal ranged from $25 to $40, gluten feed from $48 to $55, hominy from $30 to $41, and beet pulp from $42 to $46.

In the hay market No. 1 timothy ranges from $20 in Minneapolis to $26.50 in Chicago and as high as $38.50 in New York. Mixed hay and clover hay carry prices of $3 and $4 a ton under timothy.

Alfalfa hay (No. 1) was quoted at $21 in Omaha, $21.50 in Kansas City, $23 in San Francisco, $27 in Chicago and Cincinnati, and $25 in Minneapolis.

Coming Events

Jan. 24 to 29—Grain Show by the Wisconsin Agricultural Experiment Station, La Crosse. E. D. Holden, Ass't Secretary.

Jan. 27-28—Southern Wisconsin Cheesemakers' and Dairymen's Association. Secretary, Henry Elmer, Monroe.

Feb. 1-4—Manitoba Dairy Association will meet at Fort Garry Hotel, Winnipeg. Secretary, L. A. Gibson, Winnipeg.

Feb. 1-10—Mid-Winter Farmers' Course, Madison.

Feb. 1-10—Wisconsin Live Stock Breeders' Association, Madison. Geo. W. Davis, Secretary, Madison.

Feb. 4 & 5—State Live Stock Judging Tournament (roundup), Madison.

Feb. 15-17. Michigan Allied Dairy Association, Grand Rapids. Secretary, H. D. Wendt, Lansing.

Feb. 16—18, 1921—Virginia Dairy Show and Annual Convention of the State Dairymen's Association held in Roanoke. Secretary, Frank A. Buchanan, Blacksburg, Va.

The Man Who Doesn't Know

J. C. McDOWELL

TWO boys were in a row boat on a small lake in Southern Wisconsin. The boat capsized and, because they didn't know how to swim, both were drowned. A young man failed as a teacher of history because he didn't know his subject. A young lady failed as a stenographer because she was a poor speller. A merchant failed in business because he didn't keep books. Everywhere, in every occupation, you will find failures and, as a rule, the man who fails is the man who doesn't know.

An acquaintance of mine, a breeder of registered dairy cattle, thought it cost too much to test his cows for Advanced Registry. Because his cows were not tested, the offspring sold slowly and at low prices. That farmer finally lost his farm. He is now in the city working for wages. His cows were good cows and well bred, but the owner couldn't sell them on the strength of production records because they had no records. In short, he failed because he didn't know the records of his cows.

In tabulating the records of the Grove City (Pennsylvania) cow testing association, the Dairy Division found that the cows that freshened in April, May, June, and July had an average income over cost of feed of $45, while those that freshened at some other time of year had an average income over cost of feed of $60. Among the cows on test in that association there were nine cows whose owners did not know the date of freshening. For those nine cows the average income over cost of feed was $7.82. The lack of records may not have been the cause of the low production of these cows, but it does seem that the dairymen who keep breeding and production records are usually the owners of good cows.

A short time ago, B. H. Rawl, chief of the Dairy Division, made a speech at a dairymen's meeting in Kansas. Among other good things, he said: "I want the dairyman to know what he is doing. I believe he wants to know what he is doing. I don't believe the average dairyman does know, and I am frank to say that when a man doesn't know what he is doing in dairying, he is doing something rotten."

A New York dairyman built up a large herd of registered dairy cattle. He had some of the best blood lines in the country in his herd. Among his cows were some of the highest milk and butterfat producers of the breed. The herd had never been tested for tuberculosis. The cows looked to be in good health and, anyway, the owner didn't believe much in the test. Finally when he had some surplus cattle to sell he discovered that to make satisfactory sales he would have to test his cattle for tuberculosis. He did so and, to his dismay, over half the herd reacted. He had gone to great expense to build up a high-producing, pure-bred dairy herd; but he had been careless on one essential point. He failed because he didn't know that tuberculosis was spreading through his herd.

A Wisconsin farmer sold his registered Holstein bull to the local butcher. At the time of the sale, the bull had many promising daughters, but none of them had production records. Within a year from the time the bull was sold, eleven of the daughters freshened and their average production at the ages of two and three greatly surprised their owner. The average milk production of the eleven daughters was 15,047 lbs. and the average butterfat production was 571 lbs. When these records were available, the farmer knew the true value of that bull, but it was too late. Because he didn't know in time a $5,000 bull had been sold for $150.

The Wisconsin University says that the dairymen of Sheboygan County are losing a half million dollars a year through the use of scrub and grade dairy sires. These dairymen would never allow such a tremendous loss to continue if they realized what they were doing. If the dairymen in one county are losing a half million dollars a year, how tremendous must be the loss in the whole United States from the use of scrub and grade dairy bulls. That loss could easily be eliminated if every owner of dairy cattle not only knew the results that come from using scrub and grade sires in dairy herds, but would act on that knowledge.

Every dairymen should know the production records of each cow in his herd. In a herd of ten cows or more, the cow testing association will give him that knowledge at small cost. Every dairyman should own a good registered dairy bull or, if the herd is small, he should own a share in one. The cow testing associations and the bull associations take the guesswork out of dairying. They make it possible for any dairyman of ordinary intelligence to build up a high-producing and profitable dairy herd. Having available all the experimental work that has been done in connection with selection, feeding, and breeding of dairy cattle, with so many well-bred registered dairy bulls to be had at a reasonable price, and with the help of the cow testing and bull associations, there is no excuse for the dairyman who doesn't know.

Eau Claire Milk Producers' Association

The Eau Claire, Wisconsin, Milk Producers' Association was started about two years ago by a group of farmers who saw the possibilities in marketing their dairy products on a co-operative basis. Several speakers, experienced in the management of milk producers' associations, were asked to come to Eau Claire to relate their experiences and offer suggestions.

Following the meeting, one of the first things decided upon was that it would be necessary to hire a capable man to look after the business of the association. The acting secretary wrote to Madison inquiring for a man, and a year ago in July the association started its real work with a manager to look after the interests of the several individual members.

Among the more distinguished accomplishments during the past year, which stand out as milestones of progress, may be noted the following:

1. Each producer has been paid for milk or cream on the basis of accurate weights and correct weights and tests, this work being done by the association manager.

2. The association has taken a contract to supply the city milk dealer with all milk and cream used for city distribution, together with all milk used in the manufacture of ice cream. This contract is for a year and covers everything from strikes to weather. The price to be paid for milk under this contract is based on the Chicago butter and cheese markets allowing certain amounts for skimmilk and whey. The price to be paid for sweet cream is based on the Chicago market for 92 score butter. These prices have been in effect since the first of May and the method of determining prices has proven very satisfactory.

3. The surplus milk problem has been met and solved. A new Swiss cheese factory has been built at a cost of approximately $12,000. This factory, together with an American cheese factory, has established a satisfactory market for our surplus milk. At the present time the American cheese factory is closed, due to the price of American cheese, and all of the surplus milk is being made into Swiss cheese. The new cultures of bacteria, isolated by Doctor Sherman of the Dairy Division of the United States Department of Agriculture, are being supplied by the department at Washington. Mr. C. M. Gere was here a few days and instructed th cheese maker in the use of the bacteria. Nothing but a "fancy" grade of cheese is being made.

4. Now that the association is on a working basis and in a position to do business, the individual member is sure of a market for his product year in and year out. He is no longer at the mercy of the dealer who may be able to use his product at the time of a shortage and then be dropped again with but brief notice. In other words, the producer looks after the production end and the management of the association looks after the marketing.

5. Under the present system of contracting all the so-called "fluid-milk" we have established a market which is comparatively steady. Dissatisfaction over great changes in price from one month to another has been eliminated to a great extent.

The association is incorporated under the laws of Wisconsin, is a non-capital stock organization, and its officers are farmers who are members of the association and also producers.

Due to the fact that the association is handling its own surplus milk it has been necessary to establish a checking system. The entire amount for any period is paid to the association, and then the individual members are paid by the association, from the total receipts, according to the quantity and quality of product supplied. A membership fee of ten dollars is required of each member. This money is used for office equipment and other incidental expenses. The monthly expenses of the association are subtracted from the total receipts and in this manner the cost to each member is proportioned to the amount of product marketed.

It would require too much space to give all the minute details connected with the numerous problems and difficulties which we have had to meet during the past year. At the present time, however, everything seems to be progressing nicely, and we are looking forward to a profitable future. —G. H. SHEPARD, in Wisconsin Institute Report.

LA VERNA LINCOLN, NEBRASKA'S NEW CHAMPION COW

LA VERNA Lincoln, the new queen among Nebraska's dairy cows, is a Holstein owned by the University Dairy Husbandry Department. She has just finished a year's record of 29,555 pounds of milk, 1,048.5 pounds fat. This ranks her as the champion milk and butter producer of Nebraska. She has produced more milk and butter than any living cow owned by any university or agricultural college in the United States. Her record is exceeded by only sixteen cows of the breed in the United States.

La Verna Lincoln was put on official test December 23, 1919, at the age of seven years, one month, and nine days. During the year, ending December 21, 1920, her average daily production has been 81 pounds of milk. Her highest daily production reached the remarkable record of 112.7 pounds or a little more than 13 gallons. Her best 7-day record was 729.0 pounds milk, 27.528 pounds fat. Before she freshened, she weighed 1,800 pounds and when her strenuous year's work ended she still weighed 1,750 pounds, showing that she still is in good condition. She is a strong, rugged, good sized, well built cow—a cow that can do lots of work—eat large quantities of coarse, rough feed, like alfalfa and corn silage, and be healthy and vigorous, ready to repeat the performance. She was bred four months ago and is safe in calf.

La Verna Lincoln is a daughter of La May, once state champion cow whose record was 26,660 pounds of milk, 772.8 pounds fat. Her sire was Sir Prince Mercedes De Kol, perhaps the best transmitter of dairy characteristics we have ever had in the Dairy Husbandry Department.

Nebraska. J. H. FRANDSEN.

Shorthorn Breaks Record

A New Jersey Shorthorn cow, Snowdrop, owned by William L. Gelschenen, has broken the record for this breed by producing 15,550 pounds of milk containing 691 pounds of fat. She exceeded her Record of Merit requirement by 130 per cent. She replaces Ruth 3d whose record was 15,559 pounds of milk containing 664 pounds of fat.

EDITORIAL COMMENT

THE consumption of oleomargarine last year was equivalent to six billion pounds of milk; that is, it would require six billion pounds of milk to manufacture the butter equivalent in pounds to the quantity of oleomargarine consumed. This six billion pounds of milk is more than was manufactured into condensed milk in the banner year. In 1919 less than five billion pounds of whole milk were manufactured into condensed and evaporated milk.

The regrettable part about this large consumption of oleomargarine is the fact that so many dairy farmers consumed their share. It is safe to guess that the dairy farmers who used oleomargarine are not readers of dairy literature and are the ones complaining the most bitterly at the present time about the decline in the prices of dairy products.

THE EMERGENCY TARIFF

Despite considerable news publicity, we have not been deeply concerned regarding the Emergency Tariff Bill. We appreciate that it has passed the House of Representatives with a substantial majority, but we expect it to have a more difficult time in the Senate. Even if it passed the Senate, we are of the opinion that it will not receive the president's approval.

The Emergency Tariff Bill has been hastily drawn and illy considered. Its purpose is to bring some relief to the farmers, but its value in this regard is extremely doubtful. It places a tariff upon sheep and cattle, but there is no tariff upon frozen beef or on dairy products. There are comparatively few live sheep, or beef animals imported into this country, while butter and cheese are coming to our shores from Argentina, Denmark, New Zealand, and Australia, as well as frozen meats from many countries. It would seem that if it is desirable to have any tariff legislation it would be well to include more commodities than the present bill does.

We have a suspicion that this bill has been introduced very largely to bring peace to the minds of the farmers, and that no serious thought has been given to its ultimate effect. In fact, we have information from reliable sources that there will be no tariff or tax legislation at this session of Congress. These matters will receive attention after March 4, and we trust the dairy interests will be sufficiently alive to the situation at that time to see that their industry secures proper consideration.

PROGRESS OF FARMERS

Intense interest in the affairs of people is likely to breed impatience. We have been keenly desirous of having dairy farmers improve their agricultural methods and so secure larger returns for their efforts. We are not unmindful of the fact that, notwithstanding all the shortcomings of the American farmer, he is the most efficient farmer in the world. Through the use of modern machinery and the great store of plant food found in our soil he produces more food per man than any other farmer. Granting this to be so, he still has a tremendous opportunity to do better, and we are anxious to have him do better. The result of increased efficiency and endeavor should mean better farm homes and greater enjoyment in life. This is the goal of all sensible men.

When we survey the progress we have made in farming, noting the farm improvements made in recent years, the installation of modern conveniences in the home and stables, the improved roads, the general use of the automobile, the improved quality of seed grain and live stock, and the many other things common to the farmer now, but unheard of 25 years ago, we are encouraged and delighted with the progress the farmer has made.

Eugene Davenport, Dean of the Illinois College of Agriculture, has said: "The fundamental facts of soil fertility and crop production are slowly but surely becoming established, and the farmer has begun to shape his agricultural practice by the discoveries of science.

"When we remember that chemistry as a science dates practically from the time of the American Revolution, . . . and when we recall that the great science of bacteriology has entirely developed since the time of the Civil War . . . , it is evident that rapid progress is being made in the establishment of a truly scientific basis, and that slow as discovery seems to be, it is after all relatively rapid."

We are not only making progress in our farm practices, but science also is doing its share to bring about a larger agricultural development.

MAKING A BUSINESS OF FARMING

The unusual prices for farm products the past two years caused the land in various states to rise materially in price. This is especially true in the states of Illinois and Iowa. In some of the states like Wisconsin, New York, and Pennsylvania, while the prices of land strengthened, its advancement was no-where near that in some of the corn belt states.

A number of states have made farm surveys and have established what is known as farm management departments in the agricultural colleges. Their duty is to investigate the various incomes of the farm for the purpose of determining, if possible, some plan which the farmer may use to bring him the largest returns. Iowa has such a department which is under the management of Professor Munger. In 1914 he investigated 965 farms averaging 207 acres, the average valuation, including live stock, buildings, etc., being about $46,000. These farms at that time returned to their owners a labor income of about $300 after paying 5% interest on the investment. In 1919, using the 1914 valuation, the labor incomes of the farms investigated would have amounted to $1,379, that is when corn sold at about $1.50 a bushel, hogs at fifteen to twenty or more per hundred, and the prices of other products in about the same relation. This condition brought about a rapid rise in the price of land beginning the latter part of 1918 and continuing well along into 1919. On the new valuation of land the 1919 labor income was estimated at about $262 when the high prices of farm products then prevailing were used. If the computation had been based on the present prices of farm products there would have been no labor income.

It is fortunate for the dairy interests of Wisconsin, and we presume of other dairy states, that land values did not advance as they did in the corn belt states for we have not the readjustment to make. Dairy products did not advance in price as rapidly as did some of the other farm products. Neither have they declined in price so rapidly, which we believe is better for agriculture and for those operating farms. Those who purchased high priced lands will find it difficult to make interest on their investment and those who have not paid for their farms may lose them. This is not a healthy condition for agriculture.

We must bear in mind that farming is a family job. This has its advantage and its disadvantage. The advantage lies in the fact that the father and mother are in position to utilize the labor of their children and themselves to best advantage. Through this co-operative effort much wealth is accumulated and the family is kept together. Farming being a family job defeats the attempt to place agriculture upon the same basis as other enterprises are conducted. This is a disadvantage.

Let us explain what we mean. The prices of farm products advanced during the war so that five per cent could be paid on the investment and a good labor income paid to the manager of the farm and fair wages to his children, but the moment that this became general the land advanced sufficiently to reduce the farmers' income to less than $1.00 per day. That is what took place in Iowa, as is given by the figures of Professor Munger. The same thing took place, in a measure, in Wisconsin, and especially in the section supplying Milwaukee with milk. It could not be calculated that milk was selling at a price above cost of production, yet the farmers in that territory increased milk production over 30 per cent in the year 1919.

These facts are well worth considering when we attempt to place farming upon a basis similar to that of the manufacturer.

WAGES AND FOOD

A letter from one of our subscribers expresses what will take place if the American Federation of Labor and the Railroad Brotherhood leaders carry out their declarations that wages must be kept up. It would be nothing short of a miracle if they could carry out their plans, in view of the severe decline in the prices of farm products. Our subscriber writes, in part, as follows: "I thought it would be well for me to let you know how things are and how I figure the present farm situation. I have a family on my farm of 80 acres and I furnish the horses and cattle and implements and I give them half of the crop, so I think they can make a living. I stopped farming last spring and am glad I did. Last spring I planted 11 acres of beans and what are they worth? I could write more, but it is of no use. I am working in a saw mill and I earn more money than if I were farming. I am going to keep my farm for some day things might change."

This man has written enough to express our present economic situation. He has shown by his action the fallacy of any labor organization attempting to keep up the prices of labor when farm products have fallen far below the cost of production. Not all farmers are so situated that they can leave their farms as this man has, but there are many farmers who will, on account of prices, reduce their production. They will not hire high priced labor to carry on the farm to its full capacity and many of the two or three millions of hired men on the farms will not be satisfied to work on them for the wages which the farmers can afford to pay when wages are high in the city. It is only the foolish man who thinks that through organization artificial conditions can be created which will bring him high remuneration for labor and cheap food. These men forget that agriculture is the basic industry and that practically the prices of all commodities must sooner or later be adjusted to the prices of farm products, for unless the farmers can purchase the commodities manufactured by labor, there will be no opportunity to labor.

A western farmer at a farmers' meeting summarized the agricultural situation and its results very cogently and very much to the point. He said: "Fact is, the good Lord Almighty just stacked the deck against us this year. He gave us the biggest corn crop we ever grew, and most other crops way above anything we expected or deserved. That is what caused the price tumble all of a sudden. Of course Germany could not buy, and the prices would probably have slid down, but the bumper crop smashed things all at once. Of course we are all hurt, but it just had to come; the balloon had to come down. But you can just bet your best forty that it is bringing other things along down too, and unless other things do come down so we can hire men, and buy machinery and feed and fertililzer and what we eat and what we wear just as cheap as we are selling our corn and hogs, there ain't going to be any corn and hogs raised on my farm nor on most of my neighbors' farms, to sell to the city fellows. I can live, and I can stand that way of getting along just as long as the other fellow can."

The farmer has sustained his losses, but it is the man of the city that must now be concerned regarding the final outcome. He must expect to have his wages or his industry adjusted to meet the prices of farm products or he is likely to be hungry.

Raising Calves on Skimmilk

HOARD'S DAIRYMAN:—To be succuessful in growing skimmilk calves, the farmer must understand the proper method of feeding skimmilk. It is a well established fact that a calf properly raised on skimmilk is as good as one nursed by its mother; however, on account of ignorance and carelessness in feeding, in many localities there exists a strong prejudice against the feeding of skimmilk because of unhealthy and undersized calves that have been raised this way.

To properly raise the calf, begin on the cow before the calf is born. The cow should be dry at least four weeks before calving. During the pasture season there is no better plan than to leave her in the pasture under observation until the calf is born. If the cow is kept in the barn at calving time, she should have a roomy, clean stall where there will be no danger of the calf getting navel infection from the filth.

The new-born calf should receive the colostrum milk of its mother for the first three or four days. This is important, as the calf needs this milk to start its digestive organs working properly. The amount of whole milk to feed depends on the size and appetite of the calf. For about the first two weeks, five or six quarts, or ten to twelve pounds a day, is sufficient for a large growing calf. A small calf, as a Jersey, does not need more than eight or ten pounds a day for the first few weeks. It is best to feed the young calf three times a day for the first week or ten days. After that, twice a day is sufficient. In the normal calf, the change from whole to skimmilk can commence when the calf is three weeks old. The change should be made gradually, taking about ten days to make the change. After the change has been made to skimmilk, and as the calf grows older, the amount of milk fed can be gradually increased to eight or nine quarts a day. The milk should be fed warm. For the best development, the skimmilk should be fed until the calf is six or seven months old.

It never pays to overfeed a calf on skimmilk. Overfeeding is one of the common causes of inferior calves. Because the fat has been removed is no excuse for gorging the calf on skimmilk. Protein, none of which has been removed in skimming the milk, is the most important nutrient of milk as far as the growing calf is concerned. A good rule is to always keep the calf a little hungry. This will keep the appetite keen.

Teach the calf to eat grain and hay as soon as he will take it. This will be when he is about three weeks old, or at the time the change to skimmilk is made. By putting a little hay or grain in the calf's mouth after feeding milk, it will soon learn to eat. Corn makes a good grain feed for a skimmilk calf. It was found, by the Kansas station, that shelled corn gives equal, if not better, results than corn meal, after the calves are well started eating grain. Corn and oats, mixed half and half, with timothy or prairie hay mixed with clover or alfalfa, makes a good ration for the calf. The young calf should not be allowed all it will eat of clover or alfalfa alone, for, because of their laxative effect, large amounts of these legumes are apt to cause scours or indigestion. A small amount of grain is all that is necessary. Never feed more grain than the calf will clean up. At the age of six weeks, this will be about one-half pound a day; at the end of two months he will be eating one pound daily; and a month later two pounds a day, which is all the grain that is necessary up to six months of age.

The most common trouble in calf raising is scours or indigestion. This is brought about by overfeeding, by feeding sour or old milk, or cold milk, and by feeding in dirty pails or troughs. A bad case of scours gives the calf a setback from which it recovers very slowly. Since it is much easier to prevent scours than to cure them, certain precautions should be taken. Feed sweet, warm milk; do not overfeed; feed regularly; keep the feeding pails and mangers clean; keep the calf in clean quarters.

The calf's growth will be stunted if any of the above rules are violated. Often the first sign of scours is foul smelling dung. The bowels are usually very loose. The feed should be immediately cut to one-half the usual amount. For two or three feeding periods, add a teaspoonful per pint of milk fed of a mixture of one-half ounce formalin in 15.5 ounces of water. After two or three feeding periods, the milk may again be increased to the usual quantity. We have often checked scours by adding a handful of fine wheat flour to the milk.

A calf that has had a severe dose of scours receives a setback in growth for several weeks, and never will be as good an animal when mature as he would have been had scours been avoided.

Milk should be fed at the same temperature every day. If the milk is separated immediately after it is drawn, and fed immediately after it is separated, it does not have to be warmed for the calf. It should be fed as near the body temperature as possible. As the calf gets older, colder milk may be fed at the same temperature from day to day. Never feed sour milk to a calf accustomed to getting sweet milk. It is better to miss a feed or two than to upset the calf's stomach by such a change. Regular feeding of sour milk gives good results, providing the milk is soured properly. Calves also do well when fed on buttermilk when fed on it regularly. Any change in feed should be made gradually, and the calf watched for any disorders that may arise.

One kind of calf scours, commonly known as white scours, or calf cholera, is an infectious disease which gains entrance to the body soon after birth through the freshly broken navel cord. The symptoms are sunken eyes, and usually a white, foul-smelling dung. This disease was considered practically incurable until a method of vaccinating with calf cholera serum was discovered. When intelligently used, this cure is quite effective, but the best remedy is prevention. Keep the stall where the calf is born clean and disinfected, and disinfect the navel cord with creolin or any other good disinfectant, using it in a mild solution. Keep the calves separate for the first two months so that if any thing goes wrong, it can be immediately detected. Keeping them separate also prevents the calves from sucking each other, a disagreeable habit. After the calf is six weeks old, there is little danger of it getting scours or indigestion.

Iowa. C. O. LEVINE.

The Ophthalmic Tuberculin Test

Is the eye test for tuberculosis reliable? Is the intradermal test or tail test reliable? Can the cattle be plugged so they won't show in these two tests as on the subcutaneous test for tuberculosis?

New Douguas, Ill. O. W.

On page 1005 of our issue for December 24th will be found a short discussion of the several tests for tuberculosis.

It is somewhat more difficult for the novice to interpret properly the eye test and the intradermal test than it is the subcutaneous test. In general, these first two tests have not been considered quite as reliable and trustworthy as the other, but they do have some value in checking up and disclosing some reactors that will not show the characteristic rise in temperature. One of these large values is that all three tests can be applied at the same time without interfering with each other.

According to our understanding, an animal cannot be so treated with tuberculin that if she is tuberculous she will not, possibly, show the characteristic reaction to the intradermal test or the ophthalmic test.

Of the three tests, probably the ophthalmic, or eye test is the least reliable and its greatest value is in checking up on the others.

Milk Secretion

Will you kindly settle an argument regarding the formation of milk in the udder of a dairy cow? One party maintains that the milk is produced before milking time in the udder. The other maintains that the milk is not produced before milking time, but is in the milk glands and that the process of milking stimulates the glands so that the milk is then produced or secreted as fast as the milker draws it.

What are the milk veins? Is it not true that the milk veins contain blood, and not milk?

Madison, Wis. A. J. B.

The secretion of milk by the cow is one of the mysteries that science as yet has been unable to solve. Various theories have been proposed, but in general it is believed that milk is formed in the small sack-like bodies, known as alveoli, found in the udder of the cow. In some manner these alveoli seem to be able to extract the nutrients of the blood brought to them by the small capillaries and transmute them into milk which is entirely different in composition from the blood itself. The proteins of the milk differ from all other proteins of the body and the milk fat, also, has entirely different properties.

From the alveoli the milk passes through the network of milk ducts, and these, in turn, open into the small cavity called the milk cistern, which is just above the teat. The only actual milk in the udder at any one time will be found in this milk cistern, and this is a relatively small portion of the entire milk a cow yields at any one milking. The secretion of milk is a continuous process and the milk cistern is continually replenished until the whole mysterious process of nature is completed.

The blood which contains the nutrients is carried to the udder by means of the arteries and there diffused through the udder tissue in the manner indicated, so that the cow extracts, as it were, those necessary elements which will permit her to manufacture her milk. The blood continues its passage through the udder and passes out through the venous system. The particular veins carrying the blood from the udder are called "milk veins". These are both those which show on the under side of the body and others which are buried in the body tissue. These veins, like other veins in the body, merely carry blood. There is absolutely no circulation of milk, as one might be inclined to infer from the fact that these veins are called "milk veins".

Ventilation Flues

I am planning a ventilation system for my barn. I plan to have a register, just over the concrete foundation running along the upright walls to the ceiling and then across the ceiling to the center of the room. There will be four intakes leading to two outlets in the interior.

To remove the foul air from the interior, I plan four registers placed on the inside of the barn just over the cement foundation running through pipes up along the walls through the ceiling and out through the roof either at the ledge or at some other point that you may suggest. My greatest concern is as to the proper sizes of the pipes. I would be very grateful for any suggestion you may care to make me in the matter. This refers to the cow barn.

I would also appreciate some suggestion as to installing a similar ventilation system in the horse barn.

Toledo, Ohio. J. A. N.

The capacity of flues required to remove foul air from a stable is ascertained by considering the number of cows, horses, and other stock in the stable that must be supplied with fresh air. The exact number of stock housed in this barn is not given; however, as we understand the sketch, the cow stable is 34 ft. x 40 ft., which would accommodate about 18 head of cows.

If four flues are used for removing foul air, each flue should be 15 inches in diameter if round, or a 10x18 inch rectangular flue.

If metal flues are used, they should be galvanized, and from second story joists to ventilator they shall be insulated with some good insulating material such as "Flaxlinum" or equal. Wood flues must be double boarded with matched lumber with heavy paper between. The flues must extend above the highest point of the roof. It is the general practice to run the flues along underneath the rafters to the ridge, and into roof ventilators, of which there are a number of different kinds on the market. These ventilators are designed to secure the added benefits from wind impact and suction, without back draft or smothering. Care must be used if the flues are simply run through the roof and covered with a wood or sheet iron cap to prevent the efficiency of the flue from being impaired. If the cap is too low the draft will be smothered while a cap too high may cause down draft.

The outtake flues should commence about 12 inches above the stable floor and run as straight as possible to the roof ventilators.

In connection with the fresh air intakes it is suggested that six of these be used instead of four, as this will give a more uniform distribution of air and keep the stable temperature more uniform. If fresh air intakes are too large they create harmful drafts. The combined area of intake flues should be approximately equal to the combined area of the outtake flues. A good insulator should be placed between the stable ceiling and the flue proper to prevent frost and condensation from forming along the flues.

A separator should be placed between intake flues that meet at center of barn, or otherwise the wind will blow into one flue and out of the other. Each intake flue should have a register in ceiling with chamber so that the flow of air can be regulated.

To ventilate the horse barn, one 16-inch diameter round flue placed behind horses as near the center of barn as possible should be sufficient. A couple of fresh intakes should be run in and be opened above feed alley.

The Spanish Bull Fighter and American Bull Handler

WM. C. LEE, U. S. Dairy Division

THE daily papers recently reported the death in Spain of a famous bull fighter, who was impaled on the horns of a fierce bull. He had been a great expert, had won many plaudits, and was a popular favorite—something like Babe Ruth. He was only 33 years old, but had amassed a fortune of $100,000 by his bull-ring prowess. Yet a bull finally was too much for him.

Some American farmers also have amassed fortunes in dealing with bulls; but it was in breeding, not in fighting them. The toreador makes his money by killing the bull; the American by keeping the animal alive and in good health. With the Spaniard it is a question whether he will be able to kill the bull; with the American, the question is whether he can afford to keep it alive. For with us, unfortunately, it often happens that the bull fights against the man, though the man may not feel like quarreling at all; and the outcome of the conflict has often been the death of the unfortunate owner of a vigorous bull. It has in fact become proverbial that we should trust no bull, however good natured. Even if he has been dehorned, his heavy head and powerful muscles will crush a man to death if they come into full play.

What shall we conclude? That it is better to have nothing to do with bulls? This course is impossible, because we must have cows and calves. The dairy business can not be spared from our social economy—even though people begrudge the price of milk.

Another course is open, and has been much followed. This is to use only immature bulls, because they are gentle. The calf is harmless, of course. As he grows up, he acquires breeding power before he acquires the aggressiveness and combativeness of maturity. When these latter qualities develop the animal is called ugly, and the owner, saying he does not want to handle an ugly bull, sends him to the slaughter house.

This is a mistake. The so-called ugliness is often merely the sign of maturity and vigor. Selling off every bull that develops these qualities means that the breeder must always depend upon bulls that have not made their growth. Of course a young bull, just beginning service, has no record of performance. He is just starting his performance. It takes approximately four years for him to make a record through one of his daughters. If he proves to be a superior bull, that is one which will increase the productiveness of his daughters as compared with their dams, then he cannot continue in service after that fact is known, unless the owner will consent to keep an "ugly bull", because when he is old enough to have made a record he will act like a bull of that age. If the breeder then sells him and starts with another young bull he will again be at the mercy of luck. Perhaps the new young bull will also have the character of improving his daughters; but again he may have the character of making them worse than their mothers. Or he may be indifferent. What then? Must the breeder choose between risking his herd with a succession of untried sires, or risking his life with one of proved value but ugly?

No, there is a third course open. He can build the kind of a bull stable and corral that will enable him to keep the bull under control all the time, without exposing himself to the bull's attack. With a bull barn of the right design, the farmer can feed the bull without going into its stall. He can turn the bull out in the yard while he cleans the stable; he can bring in a cow for service, have her served, and take the bull away again—all this while he stays outside of the fence. It is not done by pressing a button either. It is done by having a bull barn and pen with the right ground plan.

Such a stable and exercise yard have been devised by the bull association specialist, Mr. Joel G. Winkjer, of the United States Dairy Division. What drew his attention to it was the fact that fear of "ugly bulls", that is, bulls of mature age and vigorous strength, is an obstacle to the working of co-operative bull associations, since an essential feature of bull associations is the practice of keeping proven sires in continuous service. This bull pen which Mr. Winkjer has devised seems to meet the difficulty very effectively; and the Dairy Division at Washington has had the plans put in the form of blue prints, which may be had free on application.

Readers of Hoard's Dairyman may remember a description of this bull pen that was written by Mr. Winkjer some months ago and appeared in the issue of March 6, 1920. It has been called the Safe Keeper bull pen, because it renders the keeper safe. It also keeps the bull safe; he does not have to be killed. By the use of this kind of a bull stable, farmers who have valuable bulls can keep them for use as long as they wish, and then sell them at a good price as tried sires.

If bull associations find some of their bulls inferior, they can dispose of these, but the good ones they can keep as long as the animals live, shifting them about from one block to another. If a high quality sire lives long enough he can go the round of the blocks, and after several years come back to the first block, and all the while be building up the herds of the members with more and more productive cows.

It is a sorry business to have excellent proved sires slaughtered simply because they display the qualities of maturity. Yet who can blame a farmer if he is unwilling to risk meeting the fate of the Spanish bull fighter—making a fortune and then being gored to death? How much better to keep the bull under control by means of the Safe Keeper bull pen, and continue to derive benefit from him year after year.

CASCADE JOHANNA ILLUSTRITES, HOLSTEIN COW, OWNED BY HOLLYWOOD FARM, WASHINGTON, WHICH DIED DECEMBER 26, 1920

She held the world's record for milk production for 24 hours with a production of 161.4 lbs. Her year's record was 30,110.1 lbs. milk, the twelfth in the world over 30,000 lbs. She was bred by Todd & Sons of Washington and purchased by Hollywood Farm at auction for the sum of $300 in 1916.

Cascade produced three calves, two males and one female. One of the males has been sold at auction for $2100, or seven times the purchase price of the cow. The other one brought $80, as he was sold before she made her record.

Profit From Grain

"A greater profit may be made from feeding grain to dairy cows this winter than ever before, on account of the low price of grain and the high price of butterfat."

A. J. McGuire, dairy specialist with the agricultural extension division of the University of Minnesota, makes this statement without qualifications of any sort. Considering the feed required for a pound of butterfat and the cost of the feed, he says:

"A ration composed of 15 pounds of clover or alfalfa hay, 30 pounds of corn silage, 5 pounds of ground oats, and 3 pounds of ground corn contains sufficient feed for a cow weighing 1,000 pounds and producing 1 pound of butterfat a day, or 25 pounds of 4 per cent milk. The cost of this ration at farm prices (December 1) may be estimated at no more than 22 cents. The whole ration can be produced on the average Minnesota farm. It is one of the most economical rations to be had, while at the same time it gets results in milk production.

"Without clover or alfalfa hay in a ration, a greater amount of grain is required for the production of a pound of butterfat a day. A ration composed of timothy or wild hay and corn stover (corn from which the ears have been husked) would require each day 15 pounds of grain composed of 5 pounds of bran, 2 pounds of oil meal, 5 pounds of ground oats, and 3 pounds of ground corn. The cost of this ration would be one-fifth more than the cost of the first one, on account of the greater amount of grain used and the more expensive grain.

"With a good grade of clover and alfalfa hay and corn silage, not much grain is required—I should say not more than 1 pound of grain to 3 or 4 pounds of milk. With a poor grade of roughage, timothy, wild hay, corn stalks, and straw, 1 pound of grain is required daily for every 2 pounds of milk produced daily.

"Roots of all kinds may be made to take the place of a part of the grain in a ration. From 7 to 10 pounds of roots are required to take the place of 1 pound of grain.

"We must keep steadfastly in mind the fact that it requires a certain amount of feed to produce a pound of butterfat, and that the amount of feed required depends upon the kind of feed and also upon the kind of cow. The average common cow is capable of producing 200 pounds of butterfat a year. The average half-blood dairy cow is capable of producing 250 pounds of butterfat a year. The average high grade and pure-bred dairy cow is capable of producing 300 pounds of butterfat a year."

Dairying Thirty Years Ago

Taken From the Issue of Hoard's Dairyman of January 9, 1891

If you are making a cattle barn, make it with plenty of windows so that it will be as full of light as you want a factory to be in which men are employed to do work that requires a good light. The cow may not need to be furnished with much light to do her work, but she does need, especially in the winter, the genial blaze of the sunshine on her and all around her, and will pay well for every warm sunny day.

⚜

We saw two fine Jersey cows kept by some parties in our city that were drinking last Saturday out of Rock river, through a hole in the ice, and this is the 19th century and Hoard's Dairyman is printed within a quarter of a mile of said hole in the ice! Is then our preaching and our labor in vain? Oh, no. It only proves over again the truth that the greatest sinners sit right in the shadow of the sanctuary.

⚜

At the Minnesota State Dairy Convention, Assistant Dairy Commissioner Lawrence read a paper containing many valuable suggestions, among which are the following:

"Three essentials to the successful creamery are honesty, cleanliness, and intelligence, and these three graces are as becoming to the patron as to the operator.

"Every transaction in and about the creamery must be honestly done, else that confidence between the patron and operator so essential to the success of each is forever gone."

Minneapolis Dairy Market

The Tilton Com. Co. advises us that best gilt-edged creamery butter is worth in that market 28 cents; fancy creamery 24 to 25c; choice dairy 17 to 20c; roll and print 14 to 15c; common dairy 8 to 12c; Cheddar cheese October make 11 to 11½ cents; Brick 12 to 14 cents; part skims 4 to 6 cents; Young Americas 10 to 11 cents; Swiss 12 to 14 cents.

⚜

In answer to the question, "What is the best way to raise a calf?" Mr. F. O. Ives answers as follows:

"Leave it with its mother, if her udder is inflamed, two or three days; then tie it up and teach it to drink. Mix a little linseed meal in its milk—a mere pinch at first, and give a small ration of clover hay, wheat bran, and linseed meal. Keep a calf in the stable and shade the window so the flies cannot torment it."

New York Butter Market

NEW YORK CITY, JANUARY 4:—The general butter market, at the beginning of the new year, is in excellent condition In fact, the general feeling is highly optimistic, which was not anticipated during November and the first part of December. Receivers were inclined to feel that there would be marked price slumps immediately following the holidays and that it would take several months for a healthy tone to develop. The one encouraging feature of present conditions is the heavy consumptive demand. Daily receipts are clearing up very readily with the exception of undergrades and foreign butter is moving as well as could be expected. The trend of the market is for advancing prices, although receivers are not encouraging price advances as they feel that eventually there must be a marked decline of butter prices. When prices are extremely high slumps cause greater losses than when values are at more reasonable figures.

There has been a development during the past week of several features which may have a bearing on the importation of Danish butter. The Danish Butter Export Committee, which has governed the butter trade of that country for the past five years, has released all restrictions on the sale of butter. That means that individuals may now export butter from that country. A report is going the rounds at present that England has made Denmark an excellent offer for its entire output of butter, the price being so high that merchants in this country would find it difficult to handle the Danish butter at any profit. If the report be true, it is very probable that less Danish butter will be imported in this country during the coming months. The advance in Danish exchange, which still continues, is making it impossible for the Danes to sell their butter at former prices. That, too, will naturally cause a curtailment of shipments of Danish butter to this country.

No large shipments of foreign butter have been received during the past week or ten days. One freighter arrived recently bearing 1,300 casks from Copenhagen. Another steamer bearing approximately 4,000 casks is soon to arrive and a third one with a very heavy load, said to be more than a million pounds, is due to leave Copenhagen January 7. It is thought that no further shipments will be sent during the month of January. Some Holland butter is reported to be on the water and several cars of New Zealand butter are en route between this city and San Francisco.

Interesting figures have just been published showing the amounts of butter that were received in this market during the past year. Domestic receipts were very low totalling 2,262,428 packages or 782,833 packages less than during the year 1919. That is accounted for in part by the disturbances on railroads during the year, by the arrival of heavy shipments of foreign butter in this market which discouraged many shippers from marketing their butter here, and also because of the condition of this market as regards undergrade butter. Prices paid for such butter were so low that manufacturers shipped elsewhere. Receipts of butter during 1919 were high because large quantities of butter passed through this port en route to Europe.

While the market has gradually strengthened during the past week, there was only one change in quotations, that being on Wednesday when prices advanced 1c. That advance was due to a scarcity of fancy butter. Undergrades, while not moving freely, are clearing up better than for some time. Receivers hope that all low grades of butter will clear before the materialization of a price slump. Quotations today were as follows: Extras (92 score), 57c; higher scoring than extras (93 score or higher), 57½@58c; firsts (90—91 score), 49 @55½c; firsts (88—89 score), 44@47c; and seconds (83—87 score), 37 @42c; Danish prices, 52@54c.

W. B. LIVERANCE.

Samuel R. Guard, for eight and a half years associate editor of the Breeder's Gazette, has accepted the work of directing the publicity and educational activities of the American Farm Bureau Federation. He was

SAMUEL R. GUARD

reared on an Ohio Farm and graduated from the Ohio State University in 1912. His practical agricultural information and his proved qualities as an entertaining and instructive writer fit him unusually well for the important position he now assumes.

Delaware Holstein-Friesian Association Meeting

The winter meeting of the Delaware Holstein-Friesian Association took place at Newark, December 30. The program for this meeting was a co-operative arrangement with the Delaware Corn Growers' Association. A large number of farmers and dairymen from all sections of Delaware and Maryland were in attendance.

The college herd was inspected during the forenoon and many favorable comments were heard regarding the splendid Holsteins, and especially the herd sire, Meadowholm Ona Ormsby. Over 200 breeders and visitors enjoyed a splendid luncheon which was served in the spacious dining hall of the college. The members and guests were welcomed by Dean C. A. McCue, who told something about the activities of the various departments of the college and explained how they were co-operating with the dairymen and farmers of the state with a view to bettering the farming and dairy conditions of the state.

The chief speaker of the occasion was D. D. Aitken, president of the Holstein-Friesian Association of America. He congratulated the breeders and dairymen upon the favorable conditions prevailing in the state. In his opinion the conditions for dairying and live stock raising are as good in Delaware as in any state in the Union, and the proximity to the large cities of the East creates a favorable market for disposing of dairy products. President Aitken recommended a more extensive use of silos among the dairymen of Delaware and also advised making a special effort to increase the average production of milk of the dairy herd. In his opinion six thousand pounds of milk per year from each cow in the herd is necessary to pay for the feed and labor incident to maintaining that particular cow and all above six thousand pounds represents the profit.

The speaker is of the opinion that it is simply a matter of breeding and selection in order to get together a herd that would average 12,000 pounds of milk per year. By keeping a good high class herd sire and raising young stock to maintain the herd, every dairyman should be able to gradually improve the milk production of his herd.

He advocated the idea of several breeders in each neighborhood combining and using a high class herd sire which would give the bull a better opportunity, as the average dairy herd in Delaware is comparatively small. This would permit the use of a better bull than any individual farmer would be likely to use. In the matter of securing a higher price for dairy products President Aitken suggested that one of the surest means of attaining this end and obtaining a material increase in the quantity of milk consumed in any large city would be to properly educate the consumer in regard to the high value of milk as an article of food.

Delaware. J. R. DANKS.

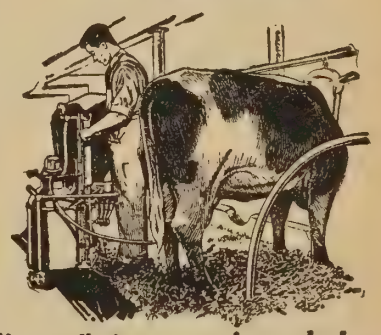
Annual Meeting of New York State Agricultural Society

The annual meeting of the New York State Agricultural Society at Albany, January 18—19, 1921, promises to be of unusual interest. The subjects to be discussed are those which have large current importance, particularly co-operative buying and selling, marketing and transportation. The gentlemen who are to discuss these subjects are eminently qualified to do so. One-half day will be given to the consideration of the problem of milk distribution.

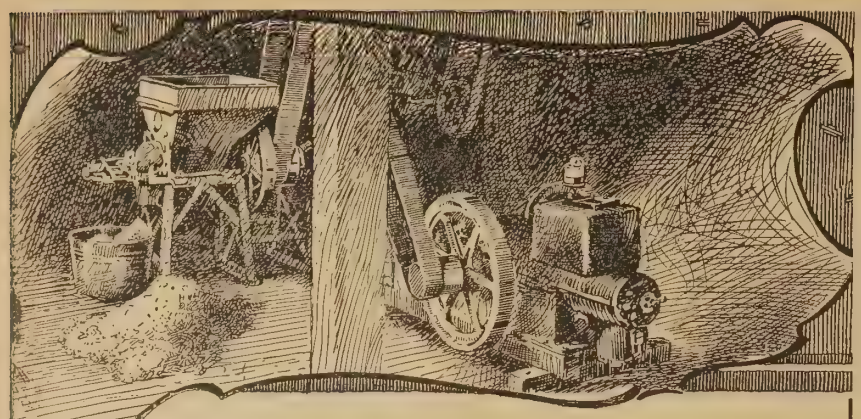
On September 7th and on December 17th and 18th important conferences were held at Syracuse over the problems of agriculture and marketing. Committees were appointed to consider various phases of these subjects. At the last session, on December 18th, the conference voted to accept an invitation to meet in connection with the annual meeting of the State Society, at which time it is expected that these committees will report, and that further steps will be taken for continuing conferences of the allied agricultural interests of New York which shall deal broadly with agricultural policies. The last half day of the annual meeting is reserved for this adjourned meeting of the conference. The one thing demanded for New York agriculture more than any other is unity in purpose and action, and it is hoped that the state-wide societies, at least, will authorize the attendance of delegates.

W. H. JORDAN, Pres.

Swelling



I have a Holstein heifer 2½ years old to freshen in April. She has a lump on her right side between the two back ribs a little larger than a good sized apple. It is soft and feels as though it was full of pus. It has been there five weeks. She has been running in wooded pasture and is getting a little thin, otherwise she seems to be all right. Can you tell me what this lump is and what I should do for it?



Minneapolis, Minn. T. T.

If a rupture is present, it will be possible to work the bowel back into the abdominal cavity by manipulating with the fingers, after which a strong truss should be built up by sticking successive layers of surgeon's tape upon the part. If pus is present, the swelling will be hot and sore, and by this time show a soft place which should be cut through for liberation of pus. Without an examination, we can not advise you which condition is present.

Complete MILKER $123!

No installation expense!—run by hand
AT LAST! A milker for every farmer—whether he has few cows or many! The Page Hand Operated Milker—only $123. One-fourth the work of milking by hand. So simple, a child can run it. Like hand milking—adjustable to any cow. Send coupon below. Find out how to end milking drudgery and solve your labor problem.
For Small or Large Herds
The man with 6 to 16 cows can use this model, never needing a power driven milker. The man with a larger herd can use it to try out machine milking in a small, inexpensive way and change later to our engine or electric power model. Hand Power model accepted in trade at almost full purchase price.
The Page, in any model, is simple—has fewer parts—therefore—costs less. Scientific, practical, easy to operate sanitary.
On Trial!
Learn how we stand back of our machine with an absolute iron clad guarantee that it must do the work if operated according to instructions. Try the Page Hand Power Milker on your herd and see, if after thirty days, you are not delighted with the results. 90 days to pay. Just find out for yourself. Write for our offer.
Send Coupon for FREE BOOK!
Let us send you our free catalog. It's full of important facts—an education in milking machines. Learn how to get the greatest milking service at the lowest cost. Learn also how you are completely protected in giving our hand power machine a trial on your own herd. Send the coupon today.

The LAUSON

New Holstein is not a natural trade center and yet it is the home of the Lauson "Frost King" Engines which for twenty-five years have been regarded as the standard of farm engine excellence. Owners swear by Lauson performance. Dealers find it the most satisfactory engine to sell. It is just as much a staple as barbed wire or milk cans.

Why should any farmer experiment with engine power because it is cheap? Thousands of farmers have equipped their farms with Lauson power—from the sturdy little 1¾ H. P. Lauson Junior for the milking machine, separator and fanning mill, to the powerful Lauson 15-30 H. P. Tractor.

And you will, too, if you will ask for a copy of our free Engine Catalog. It is a picture book of Lauson performance.

Probably half of our output of Lauson "Full Jewel" Tractors is sold to Lauson Farm Engine owners. Would you like to have this tractor catalog — ?

Association Notes

Dallas County, Iowa:—December market milk testing 3.5% sold for $3.75 per cwt. and 5c per point above. Feed prices are: corn and cob meal, $12 per ton; oats, $25; bran, $37; cottonseed meal, $55; oil meal, $60; alfalfa, $25; silage, $8; clover, $20.

De Kalb County, Illinois:—Seven boarder cows were sold during December. Dairymen received $2.60 per cwt. for 3.5% milk and 4c per point above this test. Local prices for feeds are: bran, $2 per cwt; oats, $1.70; corn, $1.07; barley, $1.50; oil meal, $3; cottonseed meal, $2.50; Union grains, $3.50; gluten, $2.50; alfalfa hay, $35 per ton; clover hay, $30.

Sullivan, Ohio:—This is a one hundred percent association in the use of pure-bred bulls. There are eleven herds in the association at present, ten of which are composed almost entirely of pure-breds. One herd has two pure-breds and the balance grades. The November price for 3.5% market milk was $3.45 per cwt. Feed prices are: clover hay, $18 per ton; silage, $6; corn, 38c per bushel; oil meal, $4 per cwt.; cottonseed meal, $4; hominy, $2.70, bran, $2.50.

First Portage, Ohio:—One of the members made application for a tuberculin test this month. Seven of the 30 herds are tested. The dairymen are figuring carefully on good and economical rations on account of high feed prices and the low prices for milk. December market milk testing 3.5% sold for $3.40 per cwt. and 5c per point above. Milk retails for 14c per quart and butter for 55c per lb. Feed prices are: silage, $8 per ton; hay, $25; corn fodder, $7; beet pulp, $50; bran, $48; gluten, $56; oil meal, $60; cottonseed meal, $68; ground oats, $30; ground corn, $38.

Geauga County, Ohio:—During November five cows produced over 60 lbs. of fat, eight produced over 50 lbs. and eighteen others produced more than 40 lbs. November milk testing 3.5% sold for $3.35 per cwt.

North Crandon, Wisconsin:—Nine unprofitable cows were disposed of and a scrub bull butchered in November. Farmers are feeding better rations than usual. Most herds are drying up. November market milk sold for 40c per gallon. The creamery paid 56—58c per lb. for fat. Milk retails for 11c per quart, butter for 65c per lb., and cheese for 32c per lb. Local prices for feed are: oats, 70c per bushel; barley, 90c per bushel; bran, $40 per ton; Wisconsin Dairy Ration, $62.50; Unicorn, $80; oil meal, $80; clover hay, $25; timothy, $26.

Richland County, Wisconsin:—Several unprofitable cows were sold to the butcher in December. A few members are increasing the feeding of balanced rations. Last year there were three Register of Production cows and this year there will be about fifteen, which shows the value of the testing association. Four per cent milk sold for $2 per cwt. in December. The condensery paid 60c per lb. for fat, the creamery paid 63c, and the cheese factory 54c. Milk retails for 11c per quart, butter for 52c per lb., and cheese for 19c per lb. Oats sold for $40 per ton; bran, $40; barley, $47; oil meal, $65; corn, $42; Schumacher, $55; silage, $8; alfalfa, $28; clover and mixed hay, $20.

Wausau—Marathon, Wisconsin:—Members are feeding more grain now that prices have declined. Eleven low producers were sold and one registered Guernsey bull purchased. Farmers are giving more thought to a proper balanced ration for their cows than they did a year ago, due, no doubt, to cow testing work. Four per cent market milk sold for $2.20 per cwt. in December, and 5½c per point above this test. The creamery paid 55c per lb. for fat and the cheese factory paid 54c per lb. Milk retails for 12—14c per quart, butter for 53c per lb., and cheese for 35c per lb. Feed prices are: hay, $20 per ton; silage, $6; bran, $37; middlings, $37; International Dairy Feed, $45; Wisconsin Balanced Ration, $56; corn meal, $40; hominy, $44; oil meal, $58; cottonseed meal, $56; barley, 80c per bushel; oats, 45c.

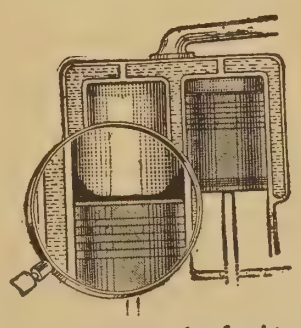
Monticello, Wisconsin:—One farmer installed water cups for his cows during November. The creamery paid $2.40 per cwt. for 3.7% milk, and 6c per point above. The condensery paid 53—60c per lb. for fat and the cheese factory about $2 per cwt. for milk. Milk retails for 10—15c per quart, butter for 60—65c per lb., and cheese for 24—30c per lb. Feed prices are as follows: silage, $8 per ton; hay, $30; bran, $33; oil meal, $54—60; oats, 52—58c per bushel; corn, 90c per bushel. Pierce Bros. sold a cow for $1,750, which is the highest priced female sold in this county at private sale. She had a seven-day record of 757.7 lbs. of milk and 25.72 lbs. of butter. She is one of three cows in the county to produce over 100 lbs. of milk a day and had the highest average. Her name is Mutual Segis Piebe DeKol.

Western Allegan County, Michigan:—November 3.5% milk sold for $3 per cwt., 4c being paid up to 4% and 6c per point above 4%. Fat sold for 54—66c per lb. at the creamery. Local prices for feeds are: hay, $17—$25 per ton; silage, $8; cottonseed meal, $55; oil meal, $75; bran,

$46; middlings, $53; corn, $53; oats, 50—65c per bushel.

Juniata County, Pennsylvania:—There were some profitable cows sold in November, the older cows being sold to make room for new ones coming in. Most of the unprofitable cows have been turned into beef. There is one proven Holstein bull in the association. Of the first six of his daughters to come in milk, not one is inferior to her dam. In most cases they are doing as well at two years as their dams at four or five years. November market milk sold for $2.85. Fat sold for 60c per lb. at the creamery. Milk retails for 12c per quart. Feed prices are: silage, $6 per ton; hay, $20; stover, $8; corn and cob meal, $38.20; ground oats, $35.20; bran, $41—$45; cottonseed meal, $65—$75.30; oil meal, $63; Peerless Dairy Feed, $70.

West Branch, Pennsylvania:—Two unprofitable cows were sold during November. Six of the members have started feeding balanced rations during this testing month. One car load of cottonseed meal was purchased by the association at $53.50. Four per cent market milk sold for $2.65 per cwt. and 4c per point above. Milk retails for 10c per quart and butter for 65c per lb. Feed prices are: corn and cob meal, $24 per ton (farm value); ground oats, $28 per ton (farm value); cottonseed meal, $53.50; linseed oil meal, $60; mixed clover and timothy hay, $27; corn stover, $6.



Tri-County, Illinois:—During November two unprofitable cows were disposed of. Three per cent milk sold for $3.40 per cwt., 2c per point being paid for 3.5% and 5c per point above 3.5%. The creamery paid 51c per lb. for fat. Milk retails for 16⅔c and 18c per quart, creamery butter for 62c per lb., and country butter for 50c per lb. Feed prices are: brown middlings, $2.10 per cwt.; gray middlings, $2.40; bran, $1.85; hominy hearts, $2.15; Purina Cow Chow, $3.40; oil meal, $3.25; cottonseed meal, $2.50; corn 85c per bushel; oats, 65c per bushel; barley, $1.10 per bushel; alfalfa, $35 per ton; clover, $32 per ton.

Marin County, California:—Two testing associations are now in operation in Marin County, California, 2,600 cows being signed up in the two. Less than 25 per cent of the herds are in the forty-pound list and over 80 per cent of the cows making forty pounds or more are in herds where pure-bred bulls are used.

Bloomfield—Sparta, Pennsylvania:—Among the 600 cows tested during the past year, 58 were sold as being unprofitable. Many more were kept at a loss to their owners. In the 47 herds tested, there are 36 pure-bred cows and 9 pure-bred bulls. Thirty-six of the members have silos and 3 have milking machines. The average production of the cows completing the year was 6,272 lbs. milk containing 251.4 lbs. fat. The average cost of feed was $102.16 and the average rate above cost of feed $111.64. The herd of John Obert lead the association in having the highest profit above feed cost. His 13 cows returned $2,104.42 above the cost of their feed. The Frank Platt herd was smaller, but the cows averaged a profit of $200.90 above. The average production of the herd was 12,029 lbs. of milk, 423.5 lbs. fat.

Oneida County, New York:—Twenty-five dairies tested with two hundred eighty-two cows in milk and one hundred five dry. Three herds are doing Advanced Register work. The list is headed for the third consecutive month by the grade Holstein cow, "Star", owned by Oscar Alberding. She produced last month 63.3 pounds of fat in 1,977 pounds of milk, and 5,881.4 pounds of milk for three months. The pure-bred Holstein junior two-year-old heifer, "June 2nd", owned by Clifford Gallup, the 15-year-old son of one of the members, made a record of 1,245 pounds of milk and 37.4 pounds of fat for the month.

In freezing weather the piston must really plow its way through oil that has congealed

"I Wonder How She'll Start"

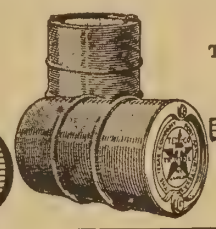
IT'S bitter cold. The snow crunches crisp at every step. Everything seems frozen into one solid piece—especially the tractor, which has been idle for hours—or even days.

"Turning her over" may be next to impossible, unless you are using the proper grade of oil.

TEXACO TRACTOL is manufactured in three grades to meet the climatic and mechanical conditions for all tractor engines, whether using kerosene or gasoline for fuel. It is refined especially for tractor engines, and its use minimizes crank-case dilution. It burns clean without excessive carbon deposits. It is *not* automobile oil, for tractors operate under extremes of temperature and pressure too severe for Auto Oil.

All operating conditions have been considered in making up the TEXACO Chart, which should be consulted and recommendations followed to secure best results.

TEXACO TRACTOL comes in 33 and 55 gallon steel drums, wooden barrels, and half barrels, and five gallon sealed cans.



Ask your TEXACO dealer what grade of TEXACO TRACTOL your tractor needs. He'll know. Then try it. You'll see a difference right away—and later when you overhaul your tractor.

Butler Road, Ohio, Testing Success

The year just ended was a very successful one for the Butler Road Cow Testing Association, Ohio. The leading cow for the year is Gerda Hengerveld 3rd, owned by P. J. Fay, with a production of 14,674.6 pounds milk containing 509.03 pounds fat. The second cow is Mobby's Nellie, a Jersey owned by George Biddle of New London, Ohio. She produced 8,528.3 pounds milk containing 495.35 pounds fat at a profit above feed cost of $292.64, in the ten months she was milked. Zwenis 2nd Fanny Girl, owned by Claud F. Searles of Wellington, produced in ten months 14,331 pounds milk, 493.03 pounds fat, at a profit over feed cost of $334.69. Fourth place is taken by Orange Blossom De Kol, owned by M. O. Fay, Ohio. This cow produced 12,290.7 pounds milk, 491.3 pounds fat, in the eight months she was milked at a profit of $447.90 above cost of feed. The fifth cow, Judy De Kol, is also owned by P. J. Fay. She produced 14,229.1 pounds milk containing 487.06 pounds fat in ten months, with a profit above feed cost of $375.61.

The leading herd is owned by Claud F. Searles. This herd averaged a production of 9,217.7 pounds milk containing 328.66 pounds fat, with an average income above cost of feed of $217.33. The second highest herd, owned by P. J. Fay, averaged 8,860.1 pounds milk containing 311.15 pounds fat, and a profit of $235.33 above feed cost.

GERDA HENGERVELD 3D, OWNED BY P. J. FAY, OHIO, IS THE LEADING COW FOR THE YEAR IN THE BUTLER ROAD COW TESTING ASSOCIATION

In the nine months she was milked she produced 14,674.6 pounds milk containing 509.03 pounds fat at a profit above feed cost of $419.91. She is shown with her two heifer calves.

Not So Bad this Month

"Now, that's better! It's the first time the expense figures haven't given me a horrid feeling.

"Why didn't I know sooner about Jell-O and some of the other money-savers?"

It doesn't matter whether you live in the city or country whether you keep an account book or not,

JELL-O

will help you out, for it is cheap as to cost and it can be made up into more different kinds of good things to eat than anything else.

Every woman who wants to know how Jell-O can help her out will find the information she desires in the Jell-O Book, which will be sent free to every woman who will send us her name and address.

Jell-O is made in six pure fruit flavors: Strawberry, Raspberry, Lemon, Orange, Chocolate, Cherry, and is sold by all grocers and dealers, 2 packages for 25 cents.

Aitken Calls for Farm Efficiency

Holstein-Friesian President Declares Three-fourths of Milk Producing Machines of Antiquated, Inferior Design

D. D. AITKEN, president of the Holstein-Friesian Association of America, in his addresses at recent Farmers' Week meetings at Ames, Iowa, and Lincoln, Nebraska, laid great stress on the necessity of the dairymen and the breeders of pure-bred dairy live stock coming to the understanding that they must work out their own salvation. He insisted that there is no reason why dairymen should succeed unless they use good judgment and good business sense. The farmer would be the first man, he said, to laugh at the idea that he was required to pay a manufacturer a profit on his operations if he was using an antiquated piece of machinery that was inefficient and wasteful, and the consumers of the dairy products and the consumers of the products of the farm generally have a right to expect that farmers and dairymen are going to use efficiency and good sense in the production of their products.

He declared, "Three-quarters of all the machines that are in use today in the production of milk on the farms are of an antiquated and inferior design, not calculated to produce at a reasonable cost. Three-quarters of all the machines that are used on the farms of the United States in the production of beef are antiquated, inefficient, scullion producing machines, only operated at a tremendous expense, and the product produced is at great cost. Yet, the beef men everywhere are wondering why the business is not more profitable.

"In every state where any dairy industry is carried on, you will find herds of cows that are averaging all the way from 4,000 lbs. of milk per year to 12,000 lbs. of milk per year, ofttimes in the same neighborhood. To assume that the man who is keeping the 4,000-lb. cows is using reasonable intelligence or is entitled to any profit on his operations is an insult to the intelligence of the consuming public and is something they will not stand for."

Mr. Aitken said he was particularly interested in calling the attention of breeders to the manner in which they should improve the quality of their registered and pure-bred animals. He said it was idle and childish for a man with two or three cows to think he could keep a worth-while herd sire. For that reason the small breeders must unite in the purchase of a first-class bull and all use him under some arrangements that they can work out among themselves. If they want the bull taken about the circuit, or if they want to take their cows to where the bull is kept, is a matter entirely for their own convenience, but if they hope to make money and raise the standard of their animals this can only be accomplished through the services of a high-class herd sire. He said, "Your cows may be improved by development, you may enhance their reputation by testing them and having them registered in the Advanced Registry, but you cannot change their nature—that remains the same; but you can improve on them through their offspring if you use the proper sire.

Of all things absolutely essential to the well-being of dairy husbandry is a better understanding on the part of the consuming public of the value of dairy products.

He said, "If the producers of milk in the states of Iowa and Nebraska would take it upon themselves they could promote a campaign of education, the echo of which would be heard in every schoolhouse in America, but the trouble is that the dairymen and the breeders are all waiting for "George" to do it instead of taking it up with their own creamery or their own distributor, and having a certain percentage of each pay check sent to the National Dairy Council to promote a better understanding of the value of the dairy products. I have sometimes thought that canvassers ought to be put out, the same as are put out by the farm bureaus, to solicit membership for the Council, and that may be necessary ultimately. It ought not to be. The creameries, the cheese factories, and the condenseries could reach practically all the producers of milk and arrange for an educational campaign. If the condenseries of the United States had perfected an organization and spent half the money in teaching the people the value of their product, that they have spent in trying to get the other fellow's customers, there would be no surplus of condensed milk in America. The dairymen, the

MONTGOMERY COUNTY, INDIANA, AYRSHIRE CLUB

Standing from left to right are: Harvey Cochran, Wm. Fry, Jr., Clayton Patterson, Howard Donica, and Charles Norman. Kneeling: Howard Harris, Worth Cochran, Virgil Thompson, and Stanley Miller. This club has twelve members who have purchased Ayrshire heifers, paying an average of $225. It is the first calf club for this breed which has been organized in the Middle West.

BEAUCOUP SIBYL SEGIS

An Illinois Holstein owned by Beaucoup Farm, which has made 25,170.9 lbs. milk, 848.26 lbs. fat, in a year. In 7-day test begun 323 days after freshening she made 445 lbs. milk, 16.17 lbs. fat, a state record.

condenseries, the creameries, and the cheesemakers ar lamenting conditions and want of demand, and never a one in all the years that have passed has ever thought it worth while to speak well even of the product he produced."

Southern Illinois Milk Producers Capitalize at $500,000

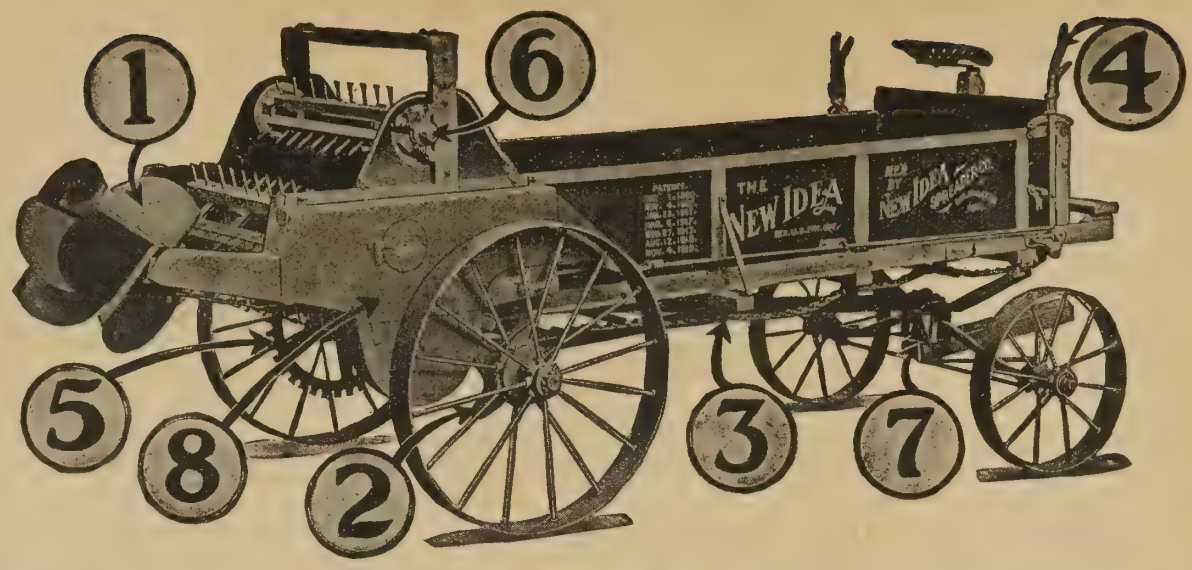
The Southern Illinois milk producers have formed a preliminary co-operative milk organization capitalized at $500,000 and each share having a par value of $100.

The Farm Advisers and County Farm Bureaus in the milk producing counties tributary to St. Louis, the Southern Illinois Milk Producers' Association, and the Illinois Agricultural Association are all working together with the view of making this co-operative milk marketing organization a real success.

The Illinois Agricultural Association has agreed: First, to furnish a

BYRON AND JOYCE PALMER AND ONE OF THEIR HOLSTEIN CALVES
Their father is an enthusiastic member of the East Troy Testing Association of Illinois.

legal adviser, make a local survey and study of milk producing territory, send a committee to learn in detail of the plans and operation of the Twin City Co-operative Milk Producers' Association, correlate the work of the county farm bureaus, and assist with effective publicity; second, to equip and maintain an office or headquarters in E. St. Louis during the stock selling campaign with the provision that the milk marketing company will take over all of the office equipment when the new marketing company secures a manager and begins operation, and also to furnish the services of the dairy marketing department as much as possible; and third, to furnish not less than the equivalent of ten men to sell stock and secure milk contracts for the new company.



It now appears that ten men for one month are not going to be able to float the stock necessary to form a permanent organization under the co-operative laws of Illinois.

The Illinois Agricultural Association is not going to drop this work in the middle—it is going to see that it is completed and put on its feet before this matter of soliciting the required amount of stock is terminated. During the first week that solicitors were in the field, about $32,000 worth of stock was subscribed for. Practically all of the milk producers agreed to sell their milk to the marketing organization. It is not all who are able to subscribe for stock, but the fact that practically all signed up a milk contract to sell the milk to the organization for five years is a good indication that the milk producers have the right co-operative spirit, and that they believe in doing business with themselves and for themselves.

Illinois. C. LARSEN.

Missouri Better Bull Campaign Rules

Two thousand dollars in cash prizes will be given in Missouri to the County Farm Bureaus showing the greatest number of scrub bulls replaced by registered bulls in their respective counties, the first prize $1,000, the second $500, third $300, and fourth $200. These are offered by the Kansas City Chamber of Commerce. Any county which at any time during the year replaces all of its scrub bulls is entitled to first prize and if more than one should replace all such bulls, the prizes will be distributed in the order as the counties become "one hundred per cent". Not less than twenty counties must compete in this contest to make the prize money available and no county is eligible to a prize unless at least twenty-five scrubs are replaced.

NEW IDEA and NISCO SPREADERS

1. **Patented Steel Distributor.** No two blades hit manure at the same time. Gives perfect distribution.
2. **Four point direct-from-axle feed.** No jarring motion or strained parts. No cams or eccentric running when driving to field.
3. **Sprocket chain conveyor** running over solid bottom. Improved construction. Saves much fertility.
4. **Lever at seat regulates loads per acre.** Spreads thinly or heavily as you wish.
5. **Direct chain drive** means greater simplicity and durability. No gears to break or freeze.
6. **Self-aligning bearings** on all cylinder and distributor shafts. No expensive replacements.
7. **No neck weight on horses** and no straining of bed. Built like a strong farm wagon with solid axle.
8. **Working parts protected** with removable shields. Keeps manure and straw from catching. Easy to oil.

YOU will never be really satisfied with manure spreading results--you will never get fullest value from manure and highest production from soil--until you use these two machines.

In the end, you *will* get either a New Idea or Nisco Spreader, as more than one hundred thousand other practical farmers have done.

Another make, priced lower, may tempt you--ONCE! Not, however, if you decide to obtain the full facts before you buy. Just fifteen minutes spent going over one of these extra strong, carefully built spreaders, will bring ***conviction.***

If you want "the best," insist on a New Idea or Nisco -- the original low-down, wide-spreading spreader. Built to spread manure better, more scientifically; to last longer and haul easier; to give you the utmost in spreader satisfaction that your money can buy.

There's a dealer near you. The coupon will bring you his name.

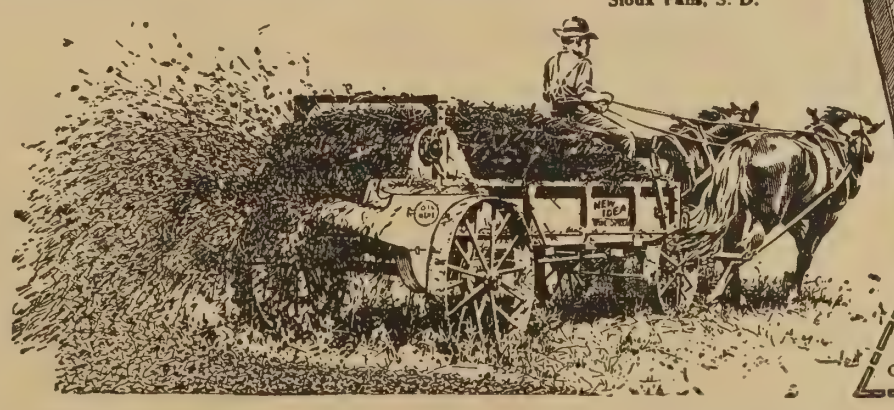
NEW IDEA
Registered U.S. Pat. Off.
The Original Wide Spreading Spreader

"NEW IDEA" and "NISCO"—two trade-marks representing spreaders that are identical in quality, in principal, in design and in mechanism, except for some minor differences in running gear which adapt them to varying field conditions in different parts of the country.

NISCO
The Original Wide Spreading Spreader

Straw Spreading Attachment Gives Double Use

A big capacity straw spreading attachment gives you double use and double spreading profits from one machine. Shreds the straw fine and spreads it evenly, 8 to 10 feet wide. One man drives and operates it. Quickly attached or taken down. Simple, light and compact, it occupies little space when not in use. Your dealer will show you, or use the coupon.



Our Gold Seal Guarantee absolutely protects you against breakage or defects.

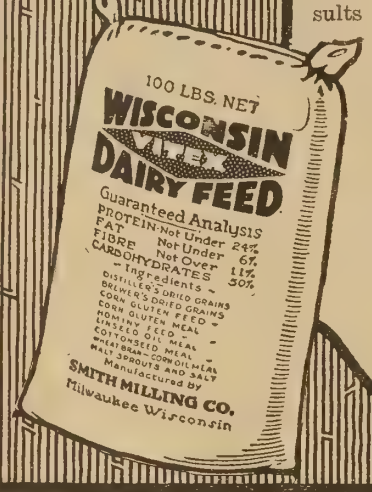
WISCONSIN VITEX DAIRY FEED



4-All is as important for your horses and meat stock as Vitex for the dairy herd.

CONSTANTLY increasing demand for this scientifically mixed dairy feed shows that dairymen appreciate the important relationship of nutrition to milk production.

Vitex increases the milk yield and builds the herd's vitality. Special mixing methods make every sack run uniform. You don't have to guess at the ration when you feed Vitex. Quantity is fixed and results are sure. That's why Vitex is regularly used by so many successful dairymen. Order Vitex today and feed it from now till grass.

It will put a bigger figure on your milk check.

Your feed dealer probably handles Vitex and 4-All. If not, write us.

Ask Mr. Nordby—*He Knows*

Last August when Mr. C. R. Nordby, Barron, Wisconsin, wanted more cork brick for his dairy barn, he wrote as follows:

> "Your cork brick in my barn are as good now as when put in five years ago. I am satisfied with them."

Short but convincingly expressive. When a practical dairyman uses Circle A Cork Brick for five years and then comes back for more, it is pretty conclusive evidence that he *is* satisfied.

Circle A Cork Brick in your stall floors will just as certainly satisfy you.

An up-to-date dairy barn at Mansfield, Ohio, where Circle A Cork Brick are used.

"Better Stall Floors" is a 28-page illustrated book, th t will tell you just what Circle A Cork Brick are and what they are doing for thousands of progressive dairymen. Send in your name for it. There is no charge.

Cow Waters Herself

with this wonderful new **Libbey Automatic Water Bowl.** Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

What the Wisconsin Dairy Council Has Accomplished

The Wisconsin Dairy Council has been organized for two years, but not until 1920 did they have a paid secretary to look after the management and to solicit financial aid. In the last eight months $6,600 has been raised from 100 creameries, 50 cheese factories, 9 condenseries, 15 ice cream manufacturers, 42 milk distributors, 39 farmers, 3 barn equipment factories, 2 farm bureaus, 4 breed associations and others interested in the dairy business of Wisconsin. Over 300,000 circulars and 1,700 posters have been distributed. Fifty some picnics and meetings were attended by representatives of the Dairy Council, where the Wisconsin Dairy Council was explained to over 15,000 people, besides reaching many by publicity through articles in state and county papers. Over 40 articles were prepared by the Field Secretary and sent to breed publications, county papers, farm papers etc. Of course many county and state papers copied these articles or revised them to suit their needs. Consequently, the dairy industry has received considerable publicity, due to the fact that an organization in the state has pushed the dairy interests, not only from a selfish business interest but from a humanitarian standpoint. Of course such influence cannot be measured as accurately as many other things, nevertheless the people have begun to think about the food value of dairy products. This sort of work, followed by the proper kind of advertising, will do a wonderful lot of good for the dairy industry.

The posters and pamphlets were distributed by county agents, home demonstration agents, county nurses, school superintendents, school teachers, women's clubs, at county fairs, breed assocations' picnics and in many other ways. Over 40 county or community fairs were supplied with attractive colored posters and literature for distribution. Many breed association picnics were supplied with the same material.

Three large state exhibits were handled by the Dairy Council. The first one in June at the Bankers' Convention at North Lake where banners and signs were displayed in a large tent, provided for showing some of Waukesha County's prize pure-bred cattle. This exhibit consisted of colored posters and other advertising with a neat display, comparing the value of a quart of milk with other foods by red ribbons running from a quart of milk to a number of other foods. During the state fair the Dairy Council had one booth featuring its membership and the food value of all dairy products. Considerable literature was given away at this booth, calling the people's attention to the food value of dairy products. In addition, two food comparison exhibits, one on cheese and the other on milk, were placed in the large coolers in the Dairy Building, comparing the energy producing material obtained from a quart of milk to that obtained from three-fourths of a pound of steak, or 2 pounds of chicken, etc. Placards with appropriate sayings about butter and cheese were placed in the respective coolers with such quotations as: "There is no substitute for butter"; "Butter contains a substance essential for the growth of the child and health of the adult"; "Cheese, the muscle builder"; "Help solve the high cost of living by eating a cheese sandwich"; and many other suggestive sayings about butter and cheese.

The Council also supplied the Dairy and Food Commission with circulars on the food value of butter and

Quit Gambling

S. C. White Leghorn Hens

Never get too fat to be prolific layers. They are excellent foragers, picking up most of their living around the farm.

Where all the feed is supplied, the White Leghorn hen or pullet eats 10 pounds less per year than other breeds. This is a statement of fact based on experiments carried on at the Connecticut Agricultural College.

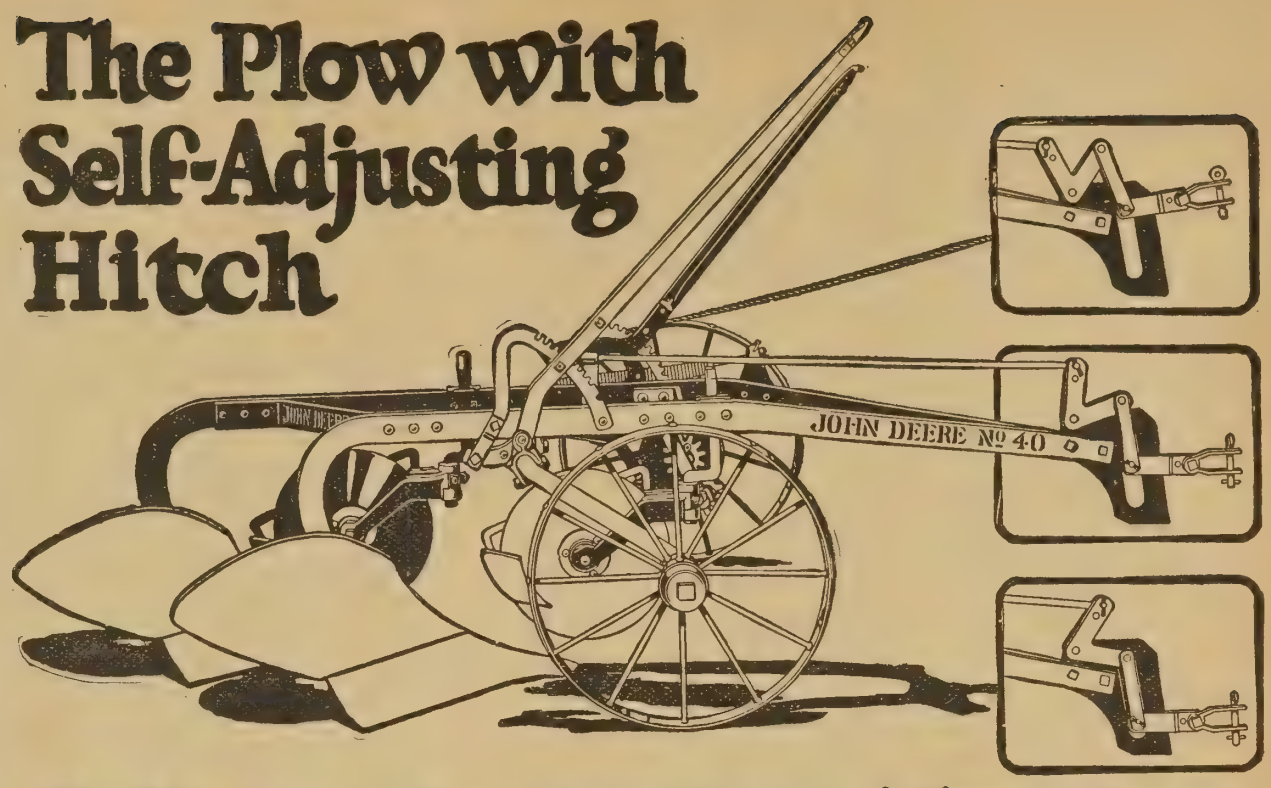
Electric Wheel Co., 31 Elm St., Quincy, Ill.

cheese, which accompanied most free samples of high grade cheese and first quality butter given away to visitors at the Wisconsin State Fair. In all over 50,000 of these circulars were distributed.

The third state exhibit was offered at the Milwaukee Food Show, where the two mottoes attracted considerable attention: "Milk Makes Other Foods Better" and "There is No Substitute For Butter." Two large milk bottles supported these signs, which loomed up well above all surrounding placards. In addition to passing out 20,000 leaflets about dairy products, a large number of dairy dish recipe books were given away. At this show, no less than six oleomargarine concerns were represented and gave away free samples of their product, which goes to illustrate that the dairymen will have to wake up and do likewise or their business will be slipping away from them. Coffee and tea companies were there in large numbers providing free samples of their product, and I dare say that the most of them were using the highest grade cream possible to give their coffee the desired flavor, yet the coffee got all the credit. More exhibits of this kind must be staged by the Dairy Council.



The farm bureaus of Waukesha and Rock Counties have decided to cooperate with the Dairy Council in putting on a campaign in their respective counties. Every school will be supplied with a complete set of attractive posters and an abundance of literature concerning milk and its products. The counties will be divided into three classes; Class 1: rural schools; Class 2: state graded schools; Class 3: city schools. The school children of each township will compete for prizes as follows: $2.50 for 1st, $1.50 second, and $1.00 for third, for the three best essays on food value of milk. The three best essays from each township and the three best from classes 2 and 3, will compete for a county prize. The Dairy Council would like to conduct a similar contest in every county in the state, but funds will not permit until the dairymen from these counties will respond with sufficient funds to carry on the work. Both Waukesha and Rock Counties will finance their own campaign. We expect other counties to do likewise.

Other schools in the state have been supplied with posters and literature upon request. All members have been supplied with posters, some of whom have had them framed and expect to display them about their town, in schools, stores, banks, etc. Literature has been supplied upon request to all desiring it.

Such are the results of the first year's work which are very small compared to what might be accomplished providing the dairymen would finance a campaign in a way worth while. Considering that most of the secretary's time has been spent in the field gathering up memberships, the Dairy Council feels well paid for its efforts, because, after all, the best results cannot be measured in dollars and cents. We are hearing more about the food value of dairy products. Not that the Dairy Council alone is active in promoting this interest but its influence has started the ball rolling and other organizations and individuals are assisting in carrying on the publicity.

The Dairy Council must first teach the child the value of milk, then teach the parents the food value of butter and cheese. There is plenty of material available to prove that there are no substitutes for dairy products but the average person does not take the time and trouble of finding out these facts, therefore, it is necessary for the dairymen to put these facts before the people in such a way that they cannot help understanding them.—J. F. THOMAS, Field Secretary.

The Plow with Self-Adjusting Hitch

Built for the Fordson Tractor

YOUR Fordson needs a plow with self-adjusting hitch. That's one of the original and important features of the No. 40—the plow that John Deere built for the Fordson. Because of this hitch, the No. 40 automatically maintains proper line of draft as depth is varied with the depth lever. Bottoms always have the proper suction—"no nosing in", no "hopping out", no "bumpy" furrows.

Any plow for use with the Fordson needs a self-adjusting hitch. Only the John Deere No. 40 has this hitch. Note the illustration above showing how the hitch of the No. 40 automatically adjusts itself to the proper line of draft as depth is varied with the depth lever.

JOHN DEERE No 40
The PLOW with the SELF-ADJUSTING HITCH

The self-adjusting hitch goes with unusual light weight and light draft plus great strength in making the John Deere No. 40, "the plow that fits the Fordson".

Built of John Deere New-Process Steel, the No. 40 is lighter than the average horse-drawn sulky; and it has tremendous strength to withstand severe plowing strains.

Beams are guaranteed not to bend or break.

Pulls extremely light—Because of proper line of draft at all times, the scouring qualities and general high grade construction of its genuine John Deere bottoms, light weight and the rigidity of its frame, the No. 40 is exceptionally light draft. It's a real fuel saver.

Simple, Positive, Power Lift—lifting parts move only when plow is being raised or lowered—practically no wear.

Does High Grade Work. The genuine John Deere bottoms insure good turning, scouring and pulverizing. They do the work the way you want it done. You can get your No. 40 equipped with John Deere bottoms of the shape and type to suit your soil.

Get Acquainted with the No. 40. You will find it is the plow your Fordson needs. Remember, the plow is the "business end" of the tractor plowing outfit. The tractor furnishes power; the plow applies that power in making the seed bed. Be sure to get a good plow for your Fordson. Write today for a folder describing the John Deere No. 40.

JOHN DEERE MOLINE, ILL

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

Does Heavy Feeding of Concentrates Pay?

Testing tells the story and so the following analysis of feeding practices is reprinted from the annual report of the Richland—Buena Vista, Wisconsin, Cow Testing Association:

"This is still a live question among many of Wisconsin's dairymen, and for those who desire some practical information on this subject the 536 cows that completed the full year in the association were divided into six groups, and tabulated according to the cost of their concentrate ration.

No. of cows	Av. cost of concentrates per cow	Av. total feed cost per cow	Av. proportion per cow Fat	Av. value of product per cow	Profit per cow
38	$57.13	$120.05	306.6	$248.41	$128.36
32	43.29	106.47	282.7	233.66	127.19
123	33.29	94.88	263.1	217.22	122.34
180	25.31	82.93	228.0	188.19	105.26
109	15.56	72.54	199.7	162.79	90.25
54	6.21	57.91	172.8	138.16	80.25

"Some interesting comparisons are afforded between groups 3, 4, and 5. In comparing groups 4 and 5 it will be found that a $10 additional investment for feed returned $15.00 more net profit, or in other words 250 per cent on the investment. By comparing groups 3 and 4 it is again found that an investment of $12 in feed yielded $17 more profit, or 233 per cent on the investment.

"As these three groups constitute over 80 per cent of the cows tested, representing all types, and under various conditions, it is safe to assume that the amount of feed is one of the most important factors in economical production with the average cow.

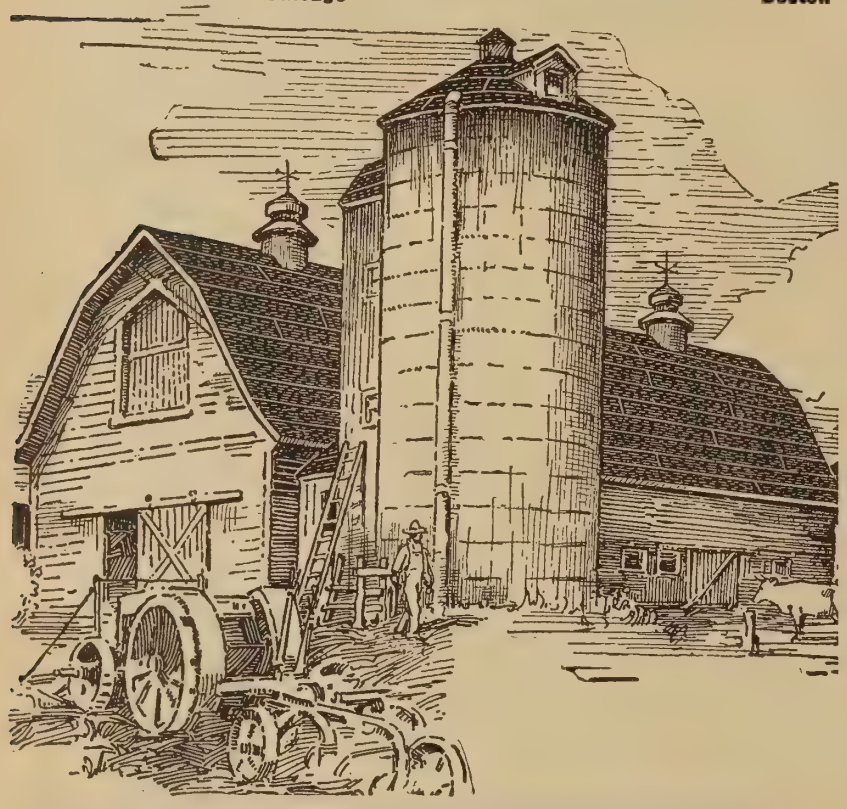
"It has often been said by the least progressive neighbors of a man who is recognized as a liberal feeder, that "He puts more into his cows than he gets out of them." The association records do not seem to bear out this statement, and it is a fact that invariably the men who make this assertion are those who do not give their cows a chance to know what liberal feeding is."

Ruberoid Facts Worth Knowing

When buying ready roofing for a new roof or for repairing an old one, remember these facts regarding Ruberoid.

The experience and the reputation of the pioneer makers of ready roofing are back of every roll.

The felt, saturating and coating compounds used in Ruberoid are the very best attainable.



For over a quarter of a century Ruberoid has set the standard for quality in ready roofings.

On many roofs it has given over twenty years of service and the limit of its endurance is yet to be found.

There are many ready roofings on the market. There is only *one* to which all these facts apply. That one is Ruberoid.

When you need ready roofing go to the Ruberoid Dealer in your town.

As Howard Sees It

I DON'T believe we want an exclusive agricultural policy. What we do want is a definite national policy in which agriculture properly articulates with all the rest of our national interests.

⚜

Marketing is one of the biggest things which any farm organization must consider in the immediate future. The farmer's business is primarily to produce.

⚜

We constitute one-third of the people of the country. It has been the business of the other two-thirds to take care of the transportation, the marketing, and the distribution. If they fail to do it with that degree of economy which will enable agriculture to fairly prosper, then perhaps the farmer himself will be compelled to venture farther than the field of production and take active interest in problems of marketing.

⚜

The farmer is going to have breakers ahead for the next five or six years. I don't look for any permanent readjustment very much earlier.

⚜

There are three outstanding things necessary at this time, and one of them is the credit situation of this country. The least which we can demand in asserting our rights is that we have a credit as farmers which will extend not over the productive year alone, but throughout the consumptive year in order that we may market our crops orderly.

⚜

We are going to have an increase in co-operative marketing in this country; not only is the farmer demanding it, but the best interests in our national life are sold on it.

What about the farmers? Well, a good many of them have already made their donations toward the prosperity of the future and as yet they are not gaining a bit. The farmer has stuck to his job and produced more this year than ever before in spite of scarcity of labor and the high price of machinery, fertilizer, feeds, and the necessities of life. "Jim" Howard is right again, "The farmer has continued to contribute an honest day's work and he has kept his head level and his feet on the ground. We must continue to look to him for our greatest stabilizing influence. We are facing an age in which industry and agriculture must move forward hand in hand—an era in which co-operation will be the keynote of all our activities—in which agriculture will be recognized as the foundation of the nation's strength. Those identified with other industries can not permanently better their condition without cultivating an understanding and a regard for agriculture.

And he is right again when he says: "The golden age for the minimum effort is forever passed. Industrial peace and agricultural prosperity will only be secured when the men whose labor feeds the world shall receive in exchange, products of industrial labor representing an equivalent in human effort. The safest, sanest, surest—in fact the only route to national prosperity, is through agriculture."

Wisconsin. A. W. HOPKINS.

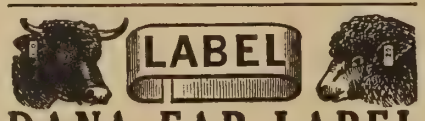
[EDITOR'S NOTE:—J. R. Howard, President of the American Farm Bureau, will be one of the speakers at the Market Conference, February 1—10, at Madison, Wisconsin. E. T. Meredith, Secretary of Agriculture; Alonzo Taylor, world famed economist; C. P. Craig authority on the lakes to ocean waterway; and Congressman A. S. Lever of South Carolina are a few of the other speakers. We assure our readers that they will be highly delighted to hear these men first hand and to learn more of what they are doing for national agriculture. It is true that Wisconsin, because it does not have "all its eggs in one basket" like so many other states, is in a far better condition agriculturally than some of her neighbors, but that makes all the better reason why bankers, newspapermen, farmers, and dealers in agriculture should be present at the round table of the conference.]

Dairying in Colorado

HOARD'S DAIRYMAN:—It is so seldom we see a communication written by the breeders of pure-bred dairy cattle in Colorado that I often wonder whether the East really knows that we have some splendid herds here and that our dairymen and farmers are making good progress in the purchase of pure-bred sires. By buying sires and sons of sires of proven production, dairymen are creating a demand for our home-bred young bulls and an interest in the breeding of better quality and higher producing animals. The local cow testing associations are very beneficial in the upbuilding of our dairy herds and farmers and dairymen are getting much out of the practical work and demonstrations in feeds and feeding by testers in charge of the work.

Speaking mostly from a Guernsey standpoint, we are very much in arrears with association work, each breeder trying individually, as it were, to push his business to the limit of his capital and herd. While all have had the pleasure of selling their young bulls and surplus females, we do not seem to be making much headway in building up a breeders' community that would attract the attention of the dairy public. Any suggestions from our neighbor Guernsey organizations would be gladly received by your western neighbors and very much appreciated.

Colorado. A. L. HARSCH.



A simple device to warm the cows' drinking water isn't a fool idea, but pays in dollars and cents in increased production.

A good winter job, some day when it's not too cold, is to go over the fences and put them in proper shape.

The Heart of the Milker

THE HEART of the Burrell Milker is its Positive Relief Pulsator, which produces sharp, well-defined, intermittent periods of suction and relief in the teat cups. The *complete intermittent* nature of these pulsations is absolutely essential to thorough and efficient milking.

Between each period of suction there is a period of complete relief from all suction, during which time air is admitted to the teat cups, and atmospheric pressure is instantly restored to normal. This permits natural circulation in the teats and prevents the congestion which would result from long periods of suction without relief.

The Burrell Positive Relief Pulsator is made of non-corrodible metal, free from cracks and crevices, and therefore easy to clean. The entire operating mechanism is quickly removed, and all portions of the pulsator which come in contact with the milk are easily cleansed and sterilized. The passages through the milk cocks, inspection glasses, and cylinders are large and of the same size throughout.

The Burrell Positive Relief Pulsator is *but one* of the distinctive features which make the Burrell Milker a success. There are also the Burrell Universal Teat Cup, which has no unsanitary rubber lining; the Burrell Moisture Trap, which prevents contamination of the milk from condensed vapor running back into the pail; the Burrell Automatic Controller, which has earned for the Burrell Milker the reputation that "*It Milks the Cows Clean.*"

Learn all about these and other Burrell features. Write today for booklet and complete information. Tell us the number of cows you have and why you are not already milking by machine. For convenience, use the coupon below.

Name_____ P. O._____ State_____

The State of California Makes You This Bargain Offer

The State Land Settlement Board of California will sell bona fide homeseekers an irrigated farm of 20 or 40 acres in San Joaquin Valley, with 36½ years time for deferred payments

These farms are in Farm Land Unit No. 3, consisting of 1540 acres in Merced County, the heart of the famous San Joaquin Valley, and will be offered to bona fide homeseekers.

These carefully selected lands were acquired by the State of California for settlement purposes. A complete irrigation system is being installed. Price per acre varies according to location. Five per cent of purchase price payable when deal is made; remainder in semi-annual installments, extending over a period of 36½ years, with interest at 5 per cent per annum.

When this unit is exhausted, other similar tracts will be opened up as rapidly as land can be prepared for the new settler.

An unusual opportunity to acquire a small ranch in winterless California, at a minimum cash outlay.

All deciduous fruits are profitably grown, and alfalfa is a paying crop. Ideal conditions for stock and poultry. You have benefits of established communities. Schools are ready, and fine roads. The various fruit associations have a remarkable marketing system. You raise the fruit; no bother about markets.

The Santa Fe operates five trains a day from Chicago and Kansas City to California. Two of them—the California Limited and the San Francisco Limited—are solid Pullman trains with dining cars all the way.

The Navajo, Scout, and Missionary carry standard and tourist sleepers and chair cars; meals in dining cars east of Kansas City and at station dining rooms west. Meal service for all trains by Fred Harvey. The California Limited and the Missionary have through sleepers by way of Grand Canyon of Arizona.

The Santa Fe tourist sleepers are comfortable and you save about half the berth rate. Station meals also are economical—a "square meal" for a dollar.

You Can Farm All Year in California

The State Board's booklet about these lands and plans for financing improvements, Santa Fe illustrated folders descriptive of San Joaquin Valley and the trip there, mailed on request.

Santa Fe

Let me help you plan your trip.

C. L. Seagraves, Superviser of Agriculture, Atchison, Topeka & Santa Fe Ry., 934 Railway Exchange, Chicago.

The Handiest Help

on the farm and a most important aid to increase the production of your livestock and poultry is that combined paint and disinfectant which brings sunshine and health into stables, pig pens, hen houses, dairies, cellars and outbuildings.

CARBOLA
The Disinfecting White Paint

gives more light and better sanitation than you can get by using whitewash and disinfectants, and it is applied in one operation instead of two, saving half the time and labor. It gives a snowy whiteness to walls and other surfaces, and at the same time, because of the strong disinfectant it contains, helps to keep your buildings free from lice and mites and destroys the germs of many of the contagious diseases that affect poultry, live stock and human beings.

Carbola comes in powder form and is ready to use as soon as mixed with water. No straining. No waiting. It does not clog sprayer. It does not flake, blister or peel off. Harmless to smallest chick or stock that licks a painted surface.

Use It Instead of Whitewash and Disinfectants

in every building on the farm and in the cellar of your home, in your garage, outbuildings, etc. Apply it with a brush or a spray pump to wood, brick, stone, cement or over whitewash. One gallon covers 200 square feet.

Your hardware, paint, drug or seed dealer has Carbola or can get it. If not, order direct. Prompt shipment by parcel post or express. Satisfaction, or money back.

10 lbs. (10 gals.) $1.25 and postage. 20 lbs. (20 gals.) $2.50 delivered. 50 lbs. (50 gals.) $5.00 delivered. Trial package and interesting booklet 30c postpaid. Add 25% for Texas and Rocky Mountain States.

Notable Canadian Holsteins

THESE photographs are from the Canadian herd of Holsteins owned by W. C. Houck and Sons of Ontario. In this herd large, straight topped animals of capacity and constitution are being developed. Most notable of its members is Jemima Johanna of Riverside, a 2,000-lb. cow which at 10 years made 30,373 lbs. of milk, 1,024 lbs. fat in 365 days. This cow with her daughter, granddaughter, and great granddaughters form a family group of remarkable uniformity and type. The upper cut shows the old cow, second from the right, with four of her daughters.

Below is Llenroc Lady Jemima, a four-year-old granddaughter of the old cow and a daughter of Johanna Jemima Posch, whose record is over 26,000 lbs. of milk, 972 lbs. fat. The four-year-old has recently completed a record of nearly 20,000 lbs. milk, 800 lbs. fat. This makes the three the first three generation "thousand-pound cows" in Canada, the second highest "three generation" butter cows in the world, and the fourth in milk. Five of the old cow's daughters on yearly test at this time are producing very heavily with good prospects that four will produce more than 800 lbs. fat each. Her own record and the performance of her progeny make Jemima Johanna of Riverside one of the greatest producing and reproducing cows living.

Boiler Explodes

HOARD'S DAIRYMAN:—Kindly call the attention of your readers who are interested in cheese factories and creameries to the importance of having their boilers inspected. This is the lesson of the recent tragedy at Stoughton, Wis., where the explosion on November 24, 1920, of a 20 H. P. boiler was responsible for five deaths and three other serious injuries.

This is the second tragedy of this kind in a creamery in Wisconsin. In 1919 a small 10 H. P. boiler exploded in a creamery at Loyal, completely wrecking the building and killing both the proprietor and his one employee.

Both these explosions involved boilers which had not been inspected and which were seriously defective. The Loyal boiler was in such a condition that any competent boiler inspector would have condemned it. In the Stoughton case a thin-shelled boiler which had been used for 16 years as a heating boiler carrying five to ten pounds of pressure was converted into a power boiler with over 40 lbs. of pressure.

There are many boiler owners who think that because their boiler has not yet exploded that it will never do so. But it is always "the last straw that breaks the camel's back". If a boiler is defective the defects will get worse and worse, unless promptly corrected and will finally result in loss of life and property. In a single year over 500 boiler explosions occurred in the United States. Inspections made by this commission show that one in every seven boilers is seriously defective and the percentage is even higher among the boilers used in creameries and cheese factories. Steam under pressure has greater explosive force than gunpowder.

The man who thinks he can inspect his own boiler, does not realize the foolish chance he is taking. The laws of the state require that boilers shall be inspected by boiler inspectors who have a certificate of competency from the Industrial Commission. Even a good mechanic or good boiler maker is not qualified to measure the tensile strength or determine what pressure a boiler can safely carry.

Under the laws of the state every boiler which is 10 H. P. or more and which carries a pressure of 15 lbs. or more must be inspected twice annually, once internally and once externally, except steam fire engines and boilers used exclusively for agricultural purposes. Owners who carry special boiler insurance policies get such inspection service from their insurance companies. Uninsured boilers are subject to direct inspection by the Industrial Commission and it is the duty of the owners of such boilers to notify the commission that they desire inspection. For each internal inspection the owner must pay a fee of $5, and for each external inspection of $2. This fee covers only a part of the cost of making these inspections and certainly is so small that no boiler owner can afford to violate the law.

The Cotton Gin and the Milking Machine

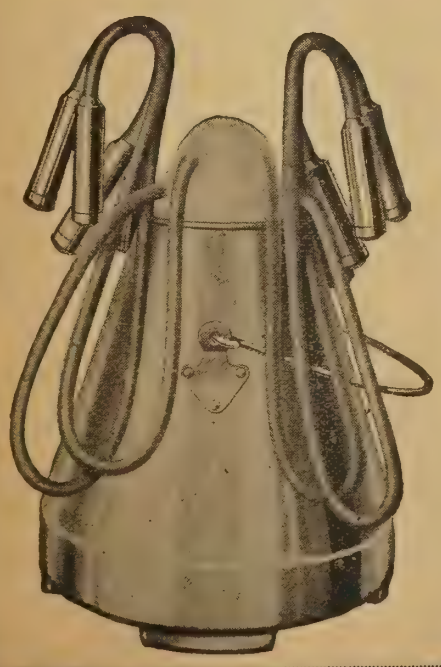
As the cotton gin increased immeasurably the prosperity of the South, the milking machine is increasing the prosperity of the dairy farmer. *One man does the work of three men milking by hand.*

"Milk, More Milk and Better Milk!" is the cry. The health-giving qualities of milk have never been so widely advertised as they are today. As a beverage it is daily becoming more popular, and new products in which milk is used, or to which milk is an addition at the table, are constantly being added to the country's foods.

The dairy farmer will be able to sell at good prices every quart of milk he produces, and the better the quality of milk, the more he will get for it.

To assure himself that he is obtaining the milking machine that means the greatest cleanliness, the lightest weight and the longest life, the dairy farmer should see that the machine he buys is equipped with a

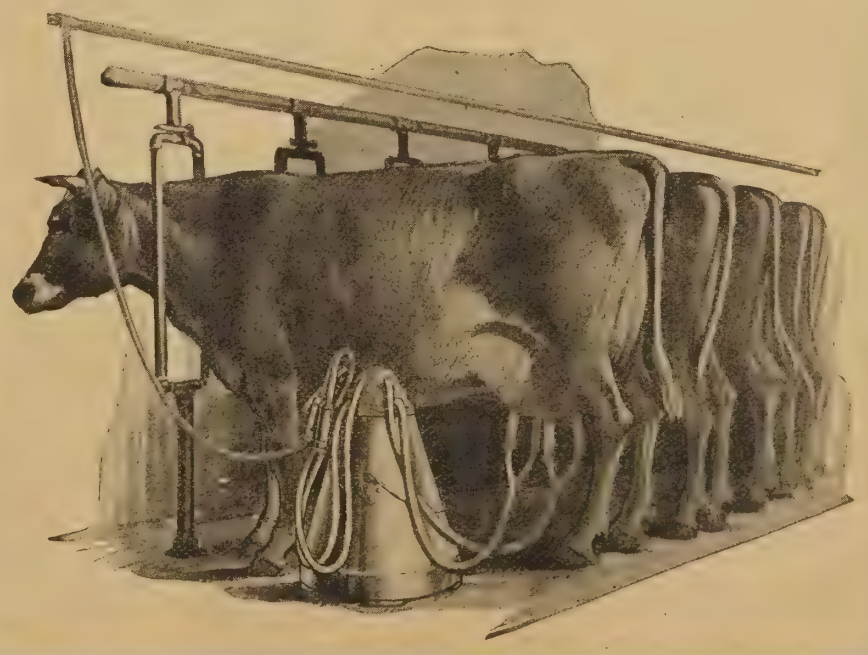
WEAR-EVER ALUMINUM TRADE MARK



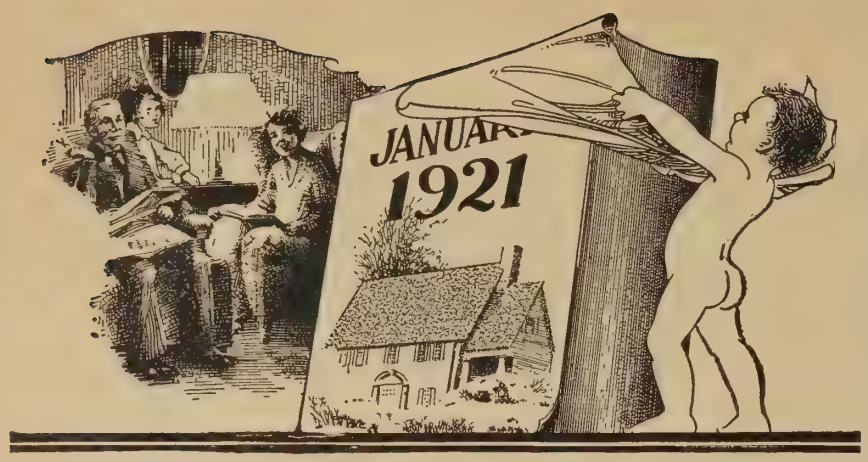
"Wear-Ever" Aluminum Milk Pail

WEAR-EVER ALUMINUM TRADE MARK

Made of solid aluminum; has NO JOINTS OR SEAMS in which bacteria may lodge. CANNOT RUST. The silver-like luster of **"Wear-Ever"**—so familiar to the housewife who has **"Wear-Ever"** utensils in her kitchen, seems to speak the words, "I am clean."



The Aluminum Cooking Utensil Company, New Kensington, Pa.



In Canada; Northern Aluminum Co., Limited, Toronto, Ontario

Note the extended bottom of the **"Wear-Ever"** Pail. This protects the bottom proper when pail is resting on ground. It is also a convenience when pouring. The extended edge is placed on the knee, and the leg and knee serve as a lifting device, making unnecessary a back or tilting handle.

Planning Time

THE beginning of the New Year is a good time to think about future betterments. Later on, when your farm duties command most of your attention, building operations are apt to be neglected, to the detriment of your property and welfare.

It is good judgment to know, well in advance of the Spring building season, just what repairing and building will be necessary to place your farm on the most efficient working basis.

It is also good judgment to include MULE-HIDE Roofing and Asphalt Shingles in your plans for better roofs.

"Not a Kick in a Million Feet"

is a record of service which MULE-HIDE has earned from its long life, durability and weather-resisting qualities.

The MULE-HIDE dealer in your locality will gladly demonstrate the superiority of MULE-HIDE Roofing and Shingles to your satisfaction. If you know of no MULE-HIDE dealer nearby, write us direct, mentioning the name of your lumber dealer.

MULE-HIDE Smooth Finish Roofing.
MULE-HIDE Slate-Kote Roofing.
MULE-HIDE Shingle-Craft Roofing.
MULE-HIDE Individual Asphalt Shingles in Standard and Double-Thick Weights.
MULE-HIDE Four-Unit Asphalt Shingles.
SEAL-SKIN and BLACK-BEAR Waterproof Building Papers.

When Writing to Advertisers, Mention Hoard's Dairyman

A New York Representative Agricultural Meeting

HOARD'S DAIRYMAN:—The number of organizations in New York State that have to do with various phases of agriculture is worthy of comment, further than that those organizations that have an interest in agricultural affairs are of large number. Thirty-eight of these organizations were invited to send representatives to a conference in Syracuse in December to discuss agricultural conditions. This was in accordance with a suggestion by Dean Mann at a meeting held in September. At this conference various dairy interests were represented. Committees were appointed soon after the members met and after some hours consultation all committees met and reported through their chairmen. Prior to the work of committees there was held an open meeting. President Dana of the Council explained that to best benefit agriculture all classes must be considered.

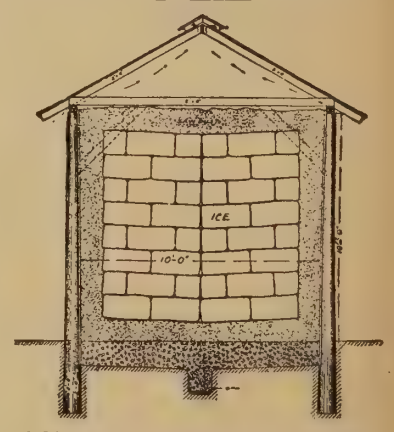
Commissioner Hogue still contends that many classes received benefits during the war that were not extended to agriculture. Industries have been built up at the expense of agriculture. For all that it is no time to retrench farming activities. At the same time to continue farming operations necessitates sufficient returns to ensure some profit. Marketing problems therefore are of interest to the whole people.

Dr. Porter finds that there have been an abundance of resolutions, but the farmer is as far from getting results as he ever has been. So far as doing business is concerned the state is far less efficient than the farmer. Municipal operation or control is to be regretted, but Dr. Porter thinks that some governmental regulation of certain marketing activities may be necessary. Co-operative sales associations may need a chain of stores, and certainly the need of grading and standardizing products cannot be overestimated. The small producer needs assistance. Wasteful competition is to be eliminated. It will be seen that Dr. Porter's ideas may well apply to the distribution of milk.

Dean Mann, every time, pleases his listeners. He, too, sees that marketing problems are paramount. We are seldom ready for what comes. There is need of preparation and of less drifting. We are committed to a policy of organization, and we agree in respect to underlying facts. Our national security depends upon the development of our farm land areas, not on new lands of doubtful value. It is important to remember that we cannot sell all we have at one time. Some should be stored for a later demand.

The finance committee did not approve the borrowing of funds from the merchant, but from the banks. Local banks are willing to make suitable loans, and it is usually the farmer who is backward about applying rather than the bank that is the cause of lack of credit. This seemed to be the general opinion of those present.

The committee on transportation seemed to have had differences. The use of motor trucks seems to be favored to a greater degree than they have before. Full loads for cars was agreed upon and a better service of refrigerator cars seems to be in full favor. It was suggested that there should be a transportation agent in the department of farms and markets.



Co-operation has the center of the bill board. It was agreed that co-operative organizations are being formed as rapidly as is consistent. It is important to avoid duplication. Some packing houses and warehouses are needed. Certain associations should affiliate in order to do a larger business. Contracts need to be clearly defined, and pooling ought to be advanced.

Our hope, says Dr. Jordan, is in united action. We have spent twenty-five years in passing resolutions, most of them worthy. Now what are you going to do to make these effective? We have machinery but not a definite policy, and our various societies do not entirely co-ordinate. Let us go at the problem in the spirit of service. The state agricultural society can render the best service in enabling the various phases of the work to function. The state Grange is of necessity such as not to be readily adapted to it, and the farm bureaus are too close to government control. A very friendly discussion followed, one side trying to get this conference to turn its activities through the farm bureau and the other through the state agricultural society, with the result that it was decided to meet at the time of the state association in Albany in January.

The committee on production believes that production should be fully kept up next year. Our state production does not nearly keep up with our increase in population. Better drainage, more time and a better use of commercial fertilizers was urged, also the use of more clover. Green manure crops and the use of farm manures were recommended. The soil survey of the state ought to be continued. Better seed, variety tests, and a better control of diseases are economic needs. Fewer dairy cows and more home grown feeds were strongly urged. We may expect something more definite when the January meeting is held as to the means of bringing about all these good things and others.

New York. H. H. LYON.

Specifications for Ice House

POST ICE HOUSE, UNINSULATED

Floor:—Consists of 12 inches of coarse gravel tamped into place.

Walls:—Posts about 3 feet center to center are set up, extending 3 feet into the ground and capped by a plate made of two pieces of 2 by 4 inch material; the inside is sheathed with 1-inch boards. The posts and boards below the ground should be treated with some preserving compound.

Ceiling:—No ceiling is provided.

Doors:—A door may be provided by cutting out the boards between two posts in the end of the house and closing the opening by placing short boards across on the inside and packing sawdust against them to keep them in place.

Drainage:—Drainage is obtained by sloping the floor of the house so that the water will run to the center. A ditch should be dug as indicated, and filled with gravel and small stones. This ditch should empty outside at a point where there is sufficient fall to carry the water away. A 3-inch porous drain tile may be provided. It should be properly trapped to prevent the entrance of warm air. —Taken from Farmers' Bulletin 1078.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, Jan. 3—Officers and directors of the National Milk Producers' Federation met in Washington this week to take up a number of pressing matters of interest in their industry. This was the first session since the meetings held in Chicago during the National Dairy Show. President Campbell and representatives of the Chicago, Cleveland, St. Louis, Pittsburg, New York, Philadelphia, Baltimore, and Washington associations were present.

One of the chief items of business was a discussion of the forthcoming report of the Bureau of Farm Management of the Department of Agriculture on the costs of milk production in the New Orleans milk producing district. This report is not out officially as yet, but a press release is being prepared which will cover some of its more salient features. The importance of this is in the fact that the officials of the New Orleans Milk Producers' Association, which happens to be an inter-state association, have been indicted on charge of being a conspiracy in restraint of trade in that their work has been to unduly enhance the selling price of their commodity. This brings this case squarely under the anti-trust laws, and the result of the independent investigation of the department experts in showing cost of production there will be a big item in the defense of the indicted men, if it shows as it is expected to do, that even the advanced prices secured for milk in New Orleans did not pay a fair profit above cost of production. The National Milk Association is much interested in this case as it involves the legal points back of the entire controversy over collective bargaining. J. D. Miller of the Dairymen's League and a director in the National Federation has been retained as associate council in the defense of the New Orleans milk producers.

Another matter before the meeting was the price situation as brought about by declining demand for milk in the cities now suffering from the industrial depression. General reports received show that nowhere has there been a decline in milk prices based on anything but the actual development of a milk surplus. The work of the various organizations in holding prices close to the cost of production is proceeding in good shape.

A third matter up for action was the inclusion of dairy products in the emergency tariff bill. Manager Warber reported that he was gathering the data upon which to base an extended argument before the Senate Finance Committee, and that he was working in harmony with the National Dairy Union, and the National Grange and the American Farm Bureau Federation in seeking to have either a straight butter tariff or, still better, a tariff on butterfat as included in all dairy imports, included in the emergency schedule.

⚜

Hon. Sidney Anderson, chairman of the sub-committee on agricultural appropriations, has written the secretary of the National Dairy Union stating that his committee will see to it that the work of the Dairy Division of the Department of Agriculture in dairy research is provided with ample funds to carry on its fundamental research projects. The effort to get a thirty thousand dollar appropriation for the needed barns is thought to be included in the projects Representative Anderson will support.

⚜

The emergency tariff bill is in the hands of the Senate Finance committee. Senator Boise Penrose, chairman of this committee has returned to Washington after more than a year's absence due to illness, and has assumed charge. Senator McCumber, who was acting chairman, was favorably inclined to this bill, while it now appears that Senator Penrose is opposed. Sponsors for the butter tariff are making a strong drive to have this item included.

⚜

Secretary of Agriculture Meredith has been enjoined from enforcing the order entered some months ago forbidding live stock firms in various live stock markets from putting into effect proposed commission charges. This controversy arose over increased charges proposed to be charged for cars containing cattle of plural ownership, and was said to be a move to make co-operative shipping unprofitable. A hearing was held, followed by a sharp statement by the secretary, and then acting under the war-time powers conferred by the Lever Act, an order fixing the rates to be charged effective August 12. Commission men in Kansas City took the matter into court, securing a temporary injunction from which the secretary appealed. This appeal has now been decided against the appellant, and the injunction made permanent, according to advices received here. The secretary proposes to carry the matter to a higher court.

⚜

Health Officer Fowler made the first move this week on his effort to enforce the obsolete law found on the District of Columbia statute book, limiting the salt and moisture in butter to a point several per cent below the legal standards permitted by the U. S. Department of Agriculture and Internal Revenue office. The details of this were told in Hoard's Dairyman some time ago. Since that time, until last week, nothing had been done by the health officers here. Now it is a restaurant keeper who has been cited into police court. Announcement is made that butter has been sampled in numerous other places and that surplus of moisture will lead to prosecutions. In spite of the reported sale of oleomargarine in several restaurants, no arrests for this evasion of the law have been reported.

⚜

Agricultural interest centers in six special legislative matters now before congress, and in two general topics of legislation. This is a brief resume of the present situation:

War Finance Corporation reviver vetoed Jan. 3 by the President, passed by the senate over the veto by a vote of 52 to 5, without debate or discussion. House vote on veto expected soon.

Emergency tariff passed House, now in Senate Finance Committee.

Packer bill not yet introduced in House; Gronna bill temporarily laid aside in Senate; vote agreement on Jan. 24.

Co-operative bargaining bill passed both houses, but Senate amendments unsatisfactory to farmer co-operative leaders; held in conference committee.

Muscle Shoals air nitrate bill is unfinished in the Senate where debate is proceeding; not reported from House Military affairs committee, but up in general debate by reason of item of ten million dollars in Sundry Civil bill, for continuing work on the Muscle Shoals dam to make Tennessee river navigable and thereby make power available for operation of plant.

Wheat futures bill was introduced in Senate by Senator Capper, in House by Representative Tincher. Hearings to begin this week by House Committee on Agriculture.

General matters, general tariff, and general revenue bill will not be formally considered until special session, but tariff hearings were begun this week by Ways and Means Committee.

Cheese Prices for December

The daily quotations of the U. S. Bureau of Markets show the following average prices on American cheese (style Twins) for three large markets in December, 1919 and 1920:

	Average price Dec., 1920	Dec., 1919
	Cents	Cents
Wisconsin boards	21.86	30.61
Chicago	22.54	30.63
New York	25.14	31.06

This represents a decline of two cents from the November average. Longhorns averaged 24.27 cents a pound on the Wisconsin Board, which is also two cents under the November average.

BELGIAN IMPORTED MELOTTE

DUTY FREE

Here Again

Jules Melotte—*"The Edison of Europe"*—has again placed his **Great Belgian Melotte Cream Separator** on the American market and is continuing his pre-war offer to the American farmer. *Free Trial—Small First Payment—Easy Terms—Duty Free.*

You, who have wanted the world's greatest separator, write for catalog right away. Find out why 500,000 Melotte Separators are in use today. Before buying any separator find out how the Melotte has won 264 Grand and International Prizes and every important European contest. Mail the coupon now for our great offer.

$10 After 30 Days Free Trial

You are not to send a cent until you have used this Great Belgian Melotte for 30 days on your own farm and thoroughly made up your mind that it is the separator you want to buy.

Easy Payments

After 30 days, when you are completely satisfied that the Belgian Imported Melotte is, by far, the best cream separator to be found any place in the world, then send only the small sum of $10.00. Settle the balance in small monthly payments. Mail coupon NOW—today.

Send this Coupon!

Fill out and mail the coupon for new Melotte catalog containing full description of this wonderful cream separator and the story of M. Jules Melotte, its inventor. Don't buy *any* separator until you have found out all you can about the Melotte and details of our 15-year guarantee. Sending coupon below does not place you under any obligation whatsoever. It brings you new Melotte catalog and full description and details of our Great Special Offer. Don't do another thing today until you have mailed coupon.

The Melotte Separator, *H. B. Babson, U. S. Mgr.*
Dept. 2851, 2843 West 19th Street, Chicago, Ill.

Self Balancing Bowl

Can't vibrate or get out of balance. Bowl chamber is porcelain lined. Easy to clean as a china plate. Can't rust. One half less tinware to clean. Bowl spins 25 minutes after you stop cranking unless you apply brake. No other separator needs a brake. Send for catalog showing details of the Melotte self-balancing bowl; also many other features.

The Melotte Separator, H. B. BABSON, U. S. Manager
Dept. 2851, 2843 W. 19th St., Chicago

Without cost to me or obligation in any way, please send me the Melotte Catalog which tells the full story of this wonderful separator and M. Jules Melotte, its inventor.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Points in Judging Cows

There are only a few points which must be kept in mind in order to discover as much as conformation indicates with reference to a cow's production. Study the six points given here and see how well your judgment lines up with the production made by cows in your herd.

Feed Capacity: Indicated by long, deep, and broad barrel in proportion to size of animal. Wide bases to side and top wedges indicate capacity. Wide forehead, long face, broad muzzle, and good sized mouth. Good spring of ribs. Ribs far apart.

Dairy Temperament: District triple wedge conformation. Sharp ends of wedges indicate temperament. Head and face and shoulders clean cut and fine quality. Bright, prominent, active eyes, and dished forehead. Fine, clean, long neck. Thighs thin and incurving. Backbone, hips, and pin bones prominent. Caution: Age, size, and stage of lactation period must be considered in judging temperament.

Constitution: Broad chest as indicated by broad base to front wedge. Large heart girth. Large, open nostrils. Oily condition of skin.

Back and Rump: Back long and straight. Rump long, straight, and level. Pin bones prominent and well apart. Hips prominent and wide apart—base of top wedge.

Milk Organs: Large, well balanced udder, quarters symmetrical and udder carried well forward and up behind. (well attached). Teats right size and far apart and symmetrical. Milk veins prominent and tortuous and large milk wells. Escutcheon high and wide.

Style and Quality: Features about head and face clean cut, oblique shoulders, comparatively bare of flesh and sharp withers, fine bone, pliable skin, hair fine and straight, secretions abundant in ear, on body and tail all indicate quality. Style as indicated by symmetry of development, making animal outstanding.

Judging Market Swine

Study the following outline for judging market swine. Become familiar with the various points and compare with the hog shown above, as far as possible. Then take this outline to the hog house and do some judging for yourself. You should be able to make intelligent judgment of the market value of the hogs in the herd.

Size and Smoothness: A long, wide, deep body approximating the parallelogram at top, side, and front. Compactly built, deep chested, and with good spring of rib and length. Arched top and straight bottom. Smoothly covered with firm flesh. Best market hog weighs 200 to 250 lbs.

Shoulders: Compact, smoothly covered, no creases or roughness, and level. Width at shoulders should be same as immediately back of them and at hips.

Back and Loin: Back well arched. Broad and with uniform width carried full length. Thickly covered with firm flesh. Broad and thick loin with hips wide and well covered. Ribs well sprung.

Feet and Legs: Stand square on strong, heavy boned, straight legs, with plenty of length. Strong pasterns with dew claws well off the ground (up on toes).

Rump and Hams: Width of hips carried back with little droop of rump. Hams wide and full to the hock, firmly fleshed.

Type or Dressing Percentage: In case of a class of swine of one breed, judge them according to the breed characteristics. Good quality indicates high dressing percentage (75-85%). Good quality as shown by fine hair lying close to the body, light and clean bone. Short and broad head. Fineness of parts. Coarseness indicates poor dressing percentage. Compactness of form, breadth of back, fullness of ham, trimness of middle, width between the eyes, and smoothness of fleshing all indicate high dressing percentage.

Junior Dairy Show at South St. Paul

THE first state Junior Dairy Show ever held in Minnesota was one of the centers of attraction at the Boys' and Girls' Junior Live Stock Show at South St. Paul recently. Quality was the feature of the show. Cold weather prevented many prospective prize winners from making the trip.

Entries in classes for yearlings and calves of all breeds except the Jerseys were received. Two yearling Holsteins were shown by Signe Bergerud and Irene Satern, first place going to Signe Bergerud, her calf showing a trifle more dairy temperament and more indication of quality throughout than that of her competitor although the latter was a remarkably smooth heifer of great constitution.

Eleven calves of the black and white breed were on exhibition and represented some very excellent breeding. First place went to Monica Zurn on a wonderfully straight topped heifer carrying a perfectly developed rump and a very good udder. Freeborn County was second with the entry of William Steele. This heifer lacked the lines and symmetry of the first entry, but showed more quality than the winner of third prize shown by Victor Anderson. This latter indi-

The "Human Hand" Planter is a Money Maker

WHY worry about *types* of corn planters. A system of planting that insures a big yield of corn is what you want. Whether the planter has two wheels or four wheels or a flat or edge drop is entirely beside the point.

Over 35 years of service have proved that the Hayes Human-Hand system positively increases crops—by overcoming the 7 causes of "bare spots." Usually the first year's increase pays for the Hayes Four-Wheel many times over.

Yet, you do not buy the Hayes upon its glorious record of mighty yields, alone. This famous planter is sold with the only *Big-Crop Guarantee* ever written on a farm implement.

This record smashing guarantee says that if the Hayes Four-Wheel does not produce a better stand of corn you may return it and the full purchase price will be refunded. Have you any other implement that literally guarantees you a bigger crop?

Go see the local Hayes dealer. Order your Hayes Four-Wheel *NOW*. Every year you put off buying a Hayes means loss. Get your Hayes now.

Hayes Pump & Planter Co., Dept. 14, Galva, Ill.

HAYES

FOUR-WHEEL PLANTER

WHAT Do *you* put in *there?*

FEED, yes. But—WHAT KIND is it?

At the fairs and dairy shows, many of the most successful dairymen tell us they get more dollars' worth of milk out of a dollar's worth of BUFFALO CORN GLUTEN FEED, fed mixed with wheat bran or millfeed, oats, etc., than any feed they know of.

They probably never had anybody offer a reason *why* BUFFALO CORN GLUTEN FEED makes milk the way it does. They did not care WHY so much, as long as they got the milk. But the *very high digestibility*, in large measure, *accounts for it.*

See that there is plenty of BUFFALO CORN GLUTEN FEED mixture in the feed trough in front of your cows—and you will understand *why* BUFFALO CORN GLUTEN FEED is so well thought of on thousands of real dairy farms.

FEED UP! Your dealer should have BUFFALO CORN GLUTEN FEED. If he does not, write us for literature and sample, giving us his name and address.

The Wonderful Attractions of BRITISH COLUMBIA

Few countries possess all the conditions for happy, prosperous living as does British Columbia. The varieties of climate and soil offer inducements for almost every branch of agriculture. Whether in the warm interior valleys, the rich grazing table lands or the fruitful lowlands of the Coast or Vancouver Island, the advantages offered for

Dairying, Fruit Growing and Stock Raising

are such as must appeal to those who wish to improve their circumstances and at the same time live in a country of delightful climate, magnificent scenery, varied resources, progressive people and abundance of opportunity for development. British Columbia—the playground of America—is already famous for the production of its orchards, fields and dairies. Now, is the time to

Learn about this wonderful Province and share in its possibilities. It's industrial life—mining, lumbering, fishing, manufacturing, transportation—assures a ready market at good prices for all the farmer can produce. Schools, churches, railways, roads, telephones, all the conveniences of an old land await you in this new Province of Opportunity and Success. For illustrated literature, maps, etc., write Department of Immigration, Ottawa, Can., or

December Condensery Prices

The following prices paid producers for one hundred pounds of 3.5% milk delivered at factories during November and December are based on reports made to the U. S. Bureau of Markets by condensed and evaporated milk firms:

Geographic sections	Nov. 1, 1920		Dec. 1, 1920	
	Case and bulk goods	Bulk goods only	Case and bulk goods	Bulk goods only
New England	$2.92	$3.91	$2.72	$3.95
Middle Atlantic	3.70	3.11	3.38	3.02
South Atlantic	3.30	2.74	3.02	2.43
E. North Central	2.43	2.97	2.24	2.95
W. North Central	2.47	2.87	2.40	2.59
Western (North)	2.03	2.99	1.93	2.94
Western (South)	2.43	3.27	2.27	
United States	2.61	3.17	2.44	2.99

The wholesale prices given below are for sales of the manufactured milk delivered to jobbers, wholesale grocers, and similar buyers at the manufacturer's distributing points on the basis of cash or short time credits:

Geographic	Sweetened condensed case of 14-oz. cans*		Unsweetened evaporated case of 16-oz. cans*	
	Oct.	Nov.	Oct.	Nov.
New England	$9.64	$9.59	$5.76	$5.32
Middle Atlantic	9.04	8.92	5.82	5.57
South Atlantic	9.87	9.92	5.85	5.79
E. North Central	9.79	9.83	5.53	5.51
W. North Central	9.67	9.70	5.78	5.66
South Central	9.69	9.83	5.89	5.84
Western (North)	9.67	9.70	5.76	5.68
Western (South)	9.60	9.63	5.65	5.71
United States	9.58	9.55	5.89	5.62

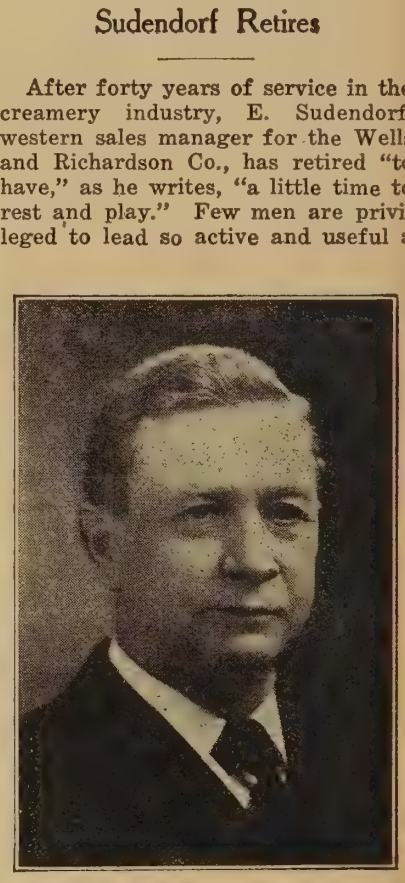
*Case contains 48 cans.

Market Slow and Draggy

The demand for condensed and evaporated milk during November and early December was very little better than previously reported. Manufacturers report that the jobbing and retail trade are purchasing according to current consumptive demands which in certain sections, especially the South, were greatly limited by the tight money situation and distressed agricultural conditions. Most manufacturers report a gradual decrease of their held stocks. There is very little if any active buying on a large scale, and some large exporters reported an 80% decrease in their export shipments. There has been some inquiry from France and Germany. A number of firms are handling the milk received, to the account of the producers, while others still have their factories closed.

Wide Range of Prices

The prices paid to producers show a rather wide range in different sections, and the average for the month of December is approximately 20c per hundredweight less than November. Stocks of condensed and evaporated milk in the hands of manufacturers on Dec. 1 had been scaled down somewhat from those on Nov. 1 but still are rather large, especially unsold stocks of bulk condensed milk which showed an increase on Dec. 1 of nearly 300 per cent over the stocks on Nov. 1.



The price of sweetened condensed bulk skimmed milk was quoted as low as $6 per hundredweight in some sections, which barely covers costs of sugar, barrels, and factory operations, to say nothing of the cost of the skimmilk used. A wide range was given for the prices of sweetened condensed and unsweetened evaporated case goods, the higher prices applying to advertised brands, while in most instances lower prices were reported for unadvertised brands.

Those countries receiving export shipments of condensed milk of over 500,000 pounds during November were Germany, the United Kingdom, and Cuba. Those receiving shipments of unsweetened evaporated of over 500,000 pounds were Belgium and the United Kingdom. The slump in exports is attributed in part to the rate of exchange prevailing between the United States and most foreign countries.

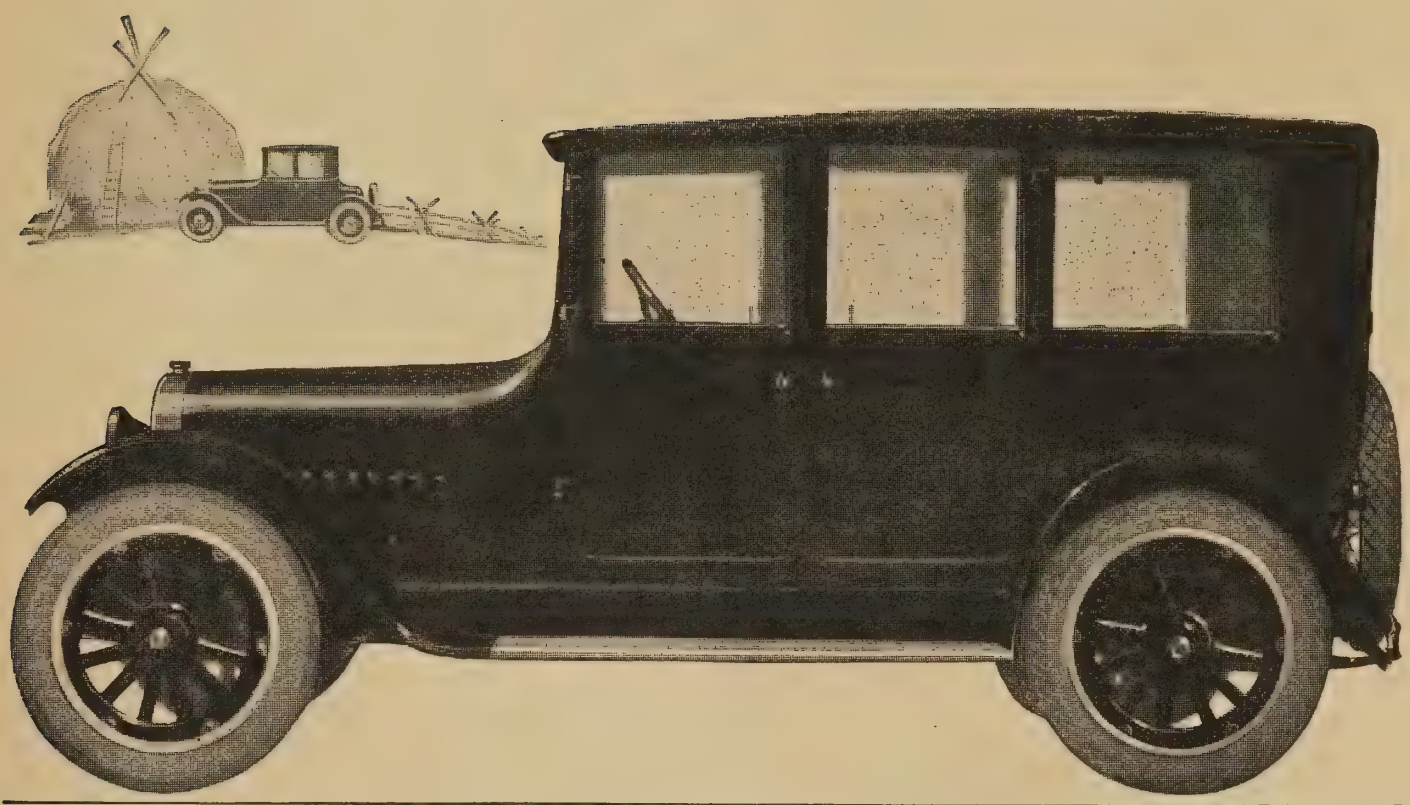
It would be problematical to attempt to state when present conditions in the condensed and evaporated milk industry will again become normal. The prevailing limited extension of credit to jobbers and wholesale dealers has tended to restrict their purchase to smaller quantities, and the tendency of consumers generally to economize in purchases of all kinds has resulted in curtailed consumption of condensed and evaporated milk. These factors, together with the decrease in export demand, have resulted in an overstocked market from which the industry is now trying to relieve itself.—U. S. Bureau of Markets.

Sudendorf Retires

After forty years of service in the creamery industry, E. Sudendorf, western sales manager for the Wells and Richardson Co., has retired "to have," as he writes, "a little time to rest and play." Few men are privileged to lead so active and useful a

E. SUDENDORF

business life, and few have so well earned a peaceful rest. He has gained the sincere friendship of many men.



Besides serving his company well, Mr. Sudendorf has given much time to general dairy activities. He started the National Dairy Show. While superintendent of the dairy department of the World's Fair in St. Louis in 1904, he conceived the idea of an annual exposition devoted entirely to the dairy industry. With the Blue Valley Creamery Company he shared the financing of the first show in February 1906. So successful was the undertaking that the National Dairy Show Association was formed in 1907, from which has grown the present yearly national exhibition of the dairy industry.

Washington Offers Creamery Short Course

A two weeks' short course in dairy manufactures will be given by the Dairy Department of the State College of Washington at Pullman, February 28th to March 11th. This course presents the latest methods of handling cream and manufacturing butter, ice cream, and cheese. Only men with six months' previous manufacturing experience will be enrolled.

Oakland

OAKLAND OWNERS REPORT RETURNS OF FROM
18 TO 25 MILES PER GALLON OF GASOLINE
AND FROM 8,000 TO 12,000 MILES ON TIRES

THIS NEW OAKLAND SENSIBLE SIX FOUR DOOR SEDAN IS POWERED WITH THE FAMOUS 44-HORSEPOWER, OVERHEAD-VALVE OAKLAND ENGINE

WHAT does the possession of this new Oakland Sensible Six Sedan mean to the farmer who drives it? It means, first of all, reliable transportation of the highest order, at the minimum of attention and expense. It means the saving of his time, in his trips to market or about the countryside, and the saving of his energy as well. It means to his family greater comfort and convenience, and an increased opportunity for recreation. Sturdy as Oakland cars always have been, this new Oakland is yet more sturdy through an even stronger chassis of longer wheelbase. Powerful, thrifty and dependable—useful the whole year 'round—it offers a value not to be equaled in any other type of car.

OPEN CAR, $1395; ROADSTER, $1395; FOUR DOOR SEDAN, $2065; COUPE, $2065

Concrete Roads and Safety First

You're safe on concrete—whether the surface is wet or dry, whether you are running in "high" or "low," uphill or down, on the straightaway or around a curve—the even, gritty surface of the concrete pavement makes you sure of car control.

You can depend on the Concrete Road—no other type gives so sure a grip for your tires, with so little tractive resistance. That's just ***one*** reason why you see Concrete Roads everywhere. It's not a sudden impulse. It's the crystallization of public opinion formed over a long period of time.

We have a booklet which tells about many other good features of Concrete Roads and how they pay for themselves. Simply ask our nearest office to send you a copy.

December Milk Prices

The following table from the U. S. Bureau of Markets' report presents a comparison of the net prices received during December by producers for fresh milk (test 3.5%) f. o. b. local shipping points or milk plants operated by fluid milk dealers:

Sections	Range of Dec. prices per cwt.	Comparison of average prices 1920 Nov.	1920 Dec.	1919 Dec.
United States	$2.28—$5.82	$3.70	$3.41	$3.77
New England	3.50— 5.05	4.30	4.23	4.18
Middle Atlantic	2.71— 3.64	3.86	3.32	3.73
E. N. Central	2.28— 4.09	3.24	2.97	3.73
W. N. Central	2.36— 3.86	3.34	3.33	3.48
South Atlantic	2.71— 5.82	4.36	4.20	3.88
E. S. Central	2.85— 4.58	3.45	3.49	4.06
W. S. Central	2.93— 5.24	4.59	4.22	4.55
Mountain	2.45— 3.47	3.14	3.14	3.18
Pacific	2.49— 4.44	3.81	3.76	3.51

Producers' and Consumers' Prices

The following table shows for certain representative city markets the prices of standard grade milk (Grade B, test 3.5%) received by producers f. o. b. city and paid by consumers during the month of December:

	Producer receives per cwt.	Consumer pays per qt.	Butterfat allowance per lb.*
Birmingham, Ala.	$3.15	$.20–.25	.90
San Francisco, Cal.	4.51	.17	.29
San Diego, Cal.	4.71	.19	
Denver, Col.	2.98	.13	.85
New Haven, Conn.	4.85	.16–.17	.40
Washington, D. C.	5.10	.17–.18	.40
Jacksonville, Fla.	5.52	.20–.25	.58
Atlanta, Ga.	5.23		flat
Chicago, Ill.	3.13	.14	.40
Indianapolis, Ind.	2.89	.14	.75
Des Moines, Ia.	3.75	.16	.50
Kansas City, Kans.			
Louisville, Ky.	3.34	.16	.50
New Orleans, La.	4.20–5.35	.17–.19	.40
Portland, Me.			
Baltimore, Md.	3.66	.15	.58
Boston, Mass.	4.88	.18	
Detroit, Mich.	3.00	.14	.40
St. Paul, Minn.	3.66	.14	.50
Kansas City, Mo.	2.86	.15–.16	
St. Louis, Mo.	3.65	.16	.30
Butte, Mont.	3.41	.15	flat
Lincoln, Neb.			
Carson City, Nev.	4.07	.12	flat
Trenton, N. J.	3.48	.13	.40
New York, N. Y.	4.95	.17	.40
Ashville, N. C.	4.50	.18	.40
Fargo, N. D.	4.07	.17	flat
Cleveland, O.	3.72	.15	.50
Cincinnati, O.	3.90	.15	.40
Oklahoma City, Okla.	3.15	.17	.90
Portland, Ore.	3.40	.14½	.50
Pittsburg, Pa.	4.36	.16	.50
Philadelphia, Pa.	3.48	.13	.40
Providence, R. I.	4.88	.18	
Sioux Falls, S. D.	3.75	.14	flat
Memphis, Tenn.	4.65–5.23	.20	flat
Dallas, Tex.	3.85	.21	1.10
Salt Lake City, Utah	3.49	.12½	flat
Burlington, Vt.	3.50	.15	flat
Seattle, Wash.	2.90	.13	
Wheeling, West Va.	4.36	.18	flat
Milwaukee, Wis.	2.75	.11	flat

*In actual practice this allowance is made on the basis of a certain price per hundred of milk of a certain test, one-tenth of the price per pound fat being paid or deducted for each one-tenth per cent above or below the stipulated basic test. Where the word "flat" appears in this column, it means that no allowances are made for butterfat content but the milk must not be lower in test than legal requirement and must not be adulterated or skimmed.

The prices quoted for producers are for milk testing 3.5 per cent and delivered f. o. b. city, from which must be deducted the various transportation costs in order to get the actual price. In certain cities the prices given apply only to that portion which is considered as the producers' average production, the surplus being either handled by the producers' association or the dealers at somewhat lower prices.

The prices given are here reduced to the comparable basis of 3.5% fat, as different cities vary from 3% to 4% as the basic fat test. To reduce the prices per hundredweight to either a gallon or a quart basis divide by 11.63 or 46.33, respectively.

The prices paid by consumers are for average testing milk delivered in quart bottles. It is the grade of milk most generally sold in these cities and in most cases is for pasteurized milk.

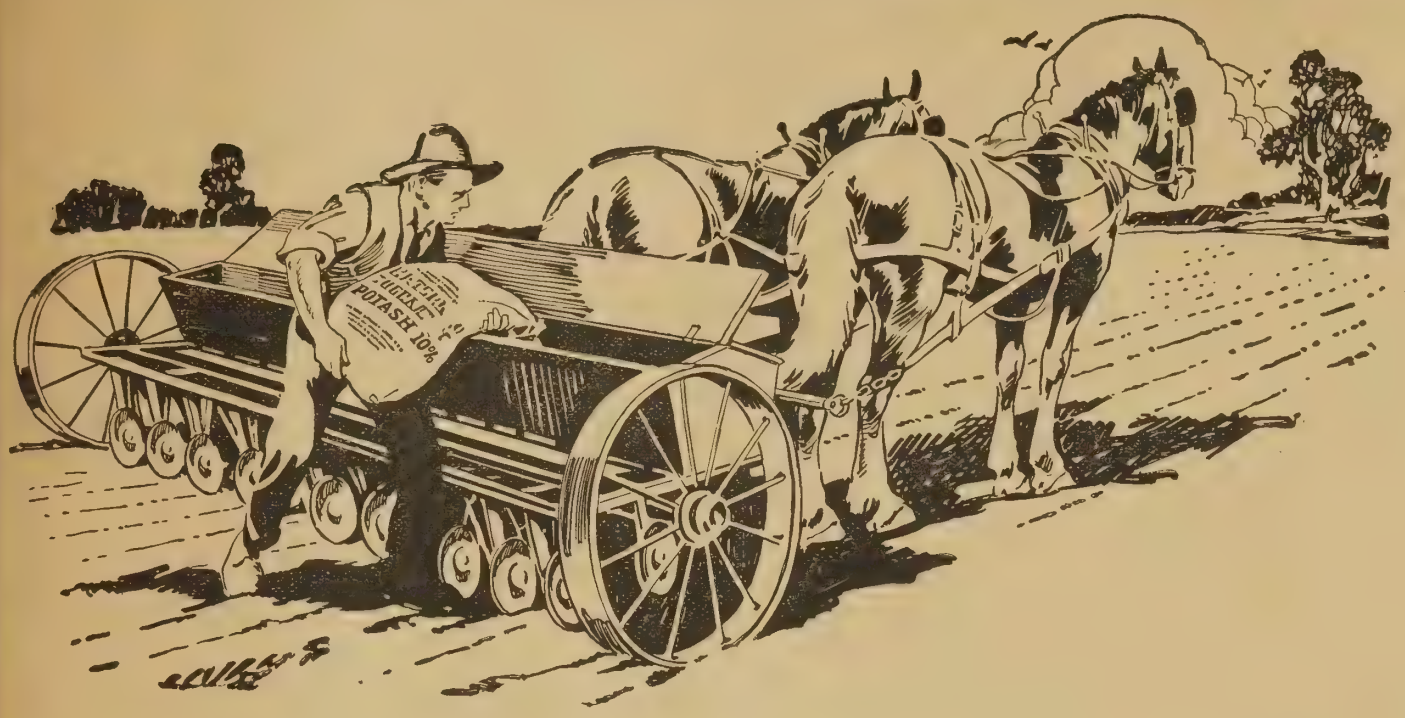
Country Shipping Stations

Prices per cwt. paid at the dealers' country receiving stations or at producers' railway shipping plants are given as follows for December:

New Haven	$3.60	Rochester	$3.24
Washington	3.50–4.18	Newark	3.38
Jacksonville	3.67	Trenton	2.88–3.53
Chicago	2.60	Buffalo	3.22
Indianapolis	2.45	New York	3.38
Baltimore	2.92	Albany	3.42
Boston	4.09	Cleveland	3.20
Kansas City	2.36–3.45	Cincinnati	3.30
St. Louis	3.15	Pittsburg	3.50
Omaha	2.50	Philadelphia	2.88

Retail Prices

The following table gives for a few cities the retail prices of special milk, certified milk, cultured buttermilk, cottage cheese, and cream for December, 1920:



Cities	Special milk per qt.	Certified milk per qt.	Buttermilk per qt.	Cottage cheese per lb.	Light cream* per ½ pt.
	Cts.	Cts.	Cts.	Cts.	Cts.
Boston	21.25	28	22	26	16
New York	20	28	12		22

WILDA LUCILLEA OF MARA ALVA

A Guernsey heifer owned by Thurman Miller, Ohio, which made an average production for April, May, and June of 1,024 lbs. milk, 43.21 lbs. fat. One of the future proprietors of the herd is holding her.

Restore the Potash

During the past few years farmers have been urged to bend every effort to produce maximum crops without giving much consideration to the effect on their soils. Established rotations were broken up and the very best parts of the farm put into the most needed crops, while the poorer parts were neglected.

In a way it was a return to the pioneer's method of mining the soil.

Today is the period of readjustment for the farmer as well as for the merchant and the manufacturer.

The farm labor situation and the uncertainty of future prices are such that prudence demands that the cost of producing a unit of crop be reduced as much as possible. This requires more crop units per acre and a return to the rotations known to be best for a given locality.

The great factor in reducing the cost of crop production is the right method of feeding the crops.

The composition of commercial plant foods has been profoundly changed during the period of Potash famine. Phosphoric Acid has replaced all or a part of the Potash in American fertilizer formulas, while just the opposite has taken place in Europe, where there was a shortage of phosphates.

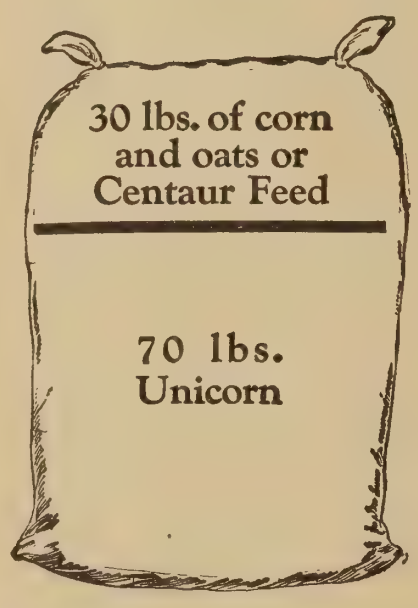
Now is the time to get back to normal again and to return to the fertilizer formulas that were so profitable and satisfactory in the past. But this cannot be done without effort on the part of the farmer and without sufficient notice to the manufacturer to prepare for the change.

Therefore think the matter over carefully, and if your previous experience has shown you that

Potash Pays

notify your dealer that you wish to use fertilizers with 5 to 10 per cent. of Potash and a little more to make up for the drain on the soil during the Potash famine.

And do it right away, for it takes time for the manufacturer to import it and it is only fair that he should know what your demands will be.



The price of Potash has fallen much faster than the prices of farm products so you may feel assured that you can again get a profit from its use. The main point is to insist that the right kind of fertilizer shall be ready for you when needed. In order to insure this, prompt action on your part is essential.

Take up the matter with your dealer at once. If we can help you write to us.

Feed Unicorn With Home-Grown Grains

Feed this way with clover hay

Centaur is a general purpose feed. Fine for young stuff and dry cows and just right for widening Unicorn.

You cannot produce milk profitably on home-grown grains alone, no matter what their price.

They will go farther and yield a real profit when fed with Unicorn Dairy Ration.

A seventy-thirty mixture is about right for most cows. It produces $4 worth of milk for each $1 worth of feed.

Don't deceive yourself. You can't mix your own grains with high-protein oil meals and beat Unicorn in final cost or results.

Feed Unicorn with home-grown grains for profit.

CHAPIN & COMPANY

Butter Prices for December

From the daily quotations of the U. S. Bureau of Markets, we have compiled the following table giving the monthly averages of the daily wholesale prices for December, 1919 and 1920, on 92-score butter (extras) in the four principal markets, together with the total receipts of butter at these markets:

	Ave. price Dec. 1920	Ave. price Dec. 1919	Receipts Dec. 1920	Receipts Dec. 1919
	Cts.	Cts.	Tubs	Tubs
Chicago	51.30	67.78	117,297	100,916
New York	54.80	72.42	133,893	160,549
Boston	53.50	71.28	32,987	27,175
Philadelphia	55.20	72.68	42,205	39,910
Total receipts			326,382	328,550

Ninety-score butter averaged 44.48 cents for December on the Chicago market, with centralized butter at this market selling for 44.43 cents. Jobbers' prices on extras sold to retailers during December averaged 52.92 cents in Chicago and 57.8 cents in New York.

The farmer has spent a good many centuries learning how to raise crops; now he is beginning to take an interest in marketing them.

Uncle Ab says: He can't find any bolshevism among men who aim to do a well finished piece of work.

SEED **By Prepaid Express—Order NOW—Prices Going Up.** Our first quality, hardy northern-grown grass seed, famous for its frost and drought resisting qualities. High and strong in germination. Registered Holstein Bulls
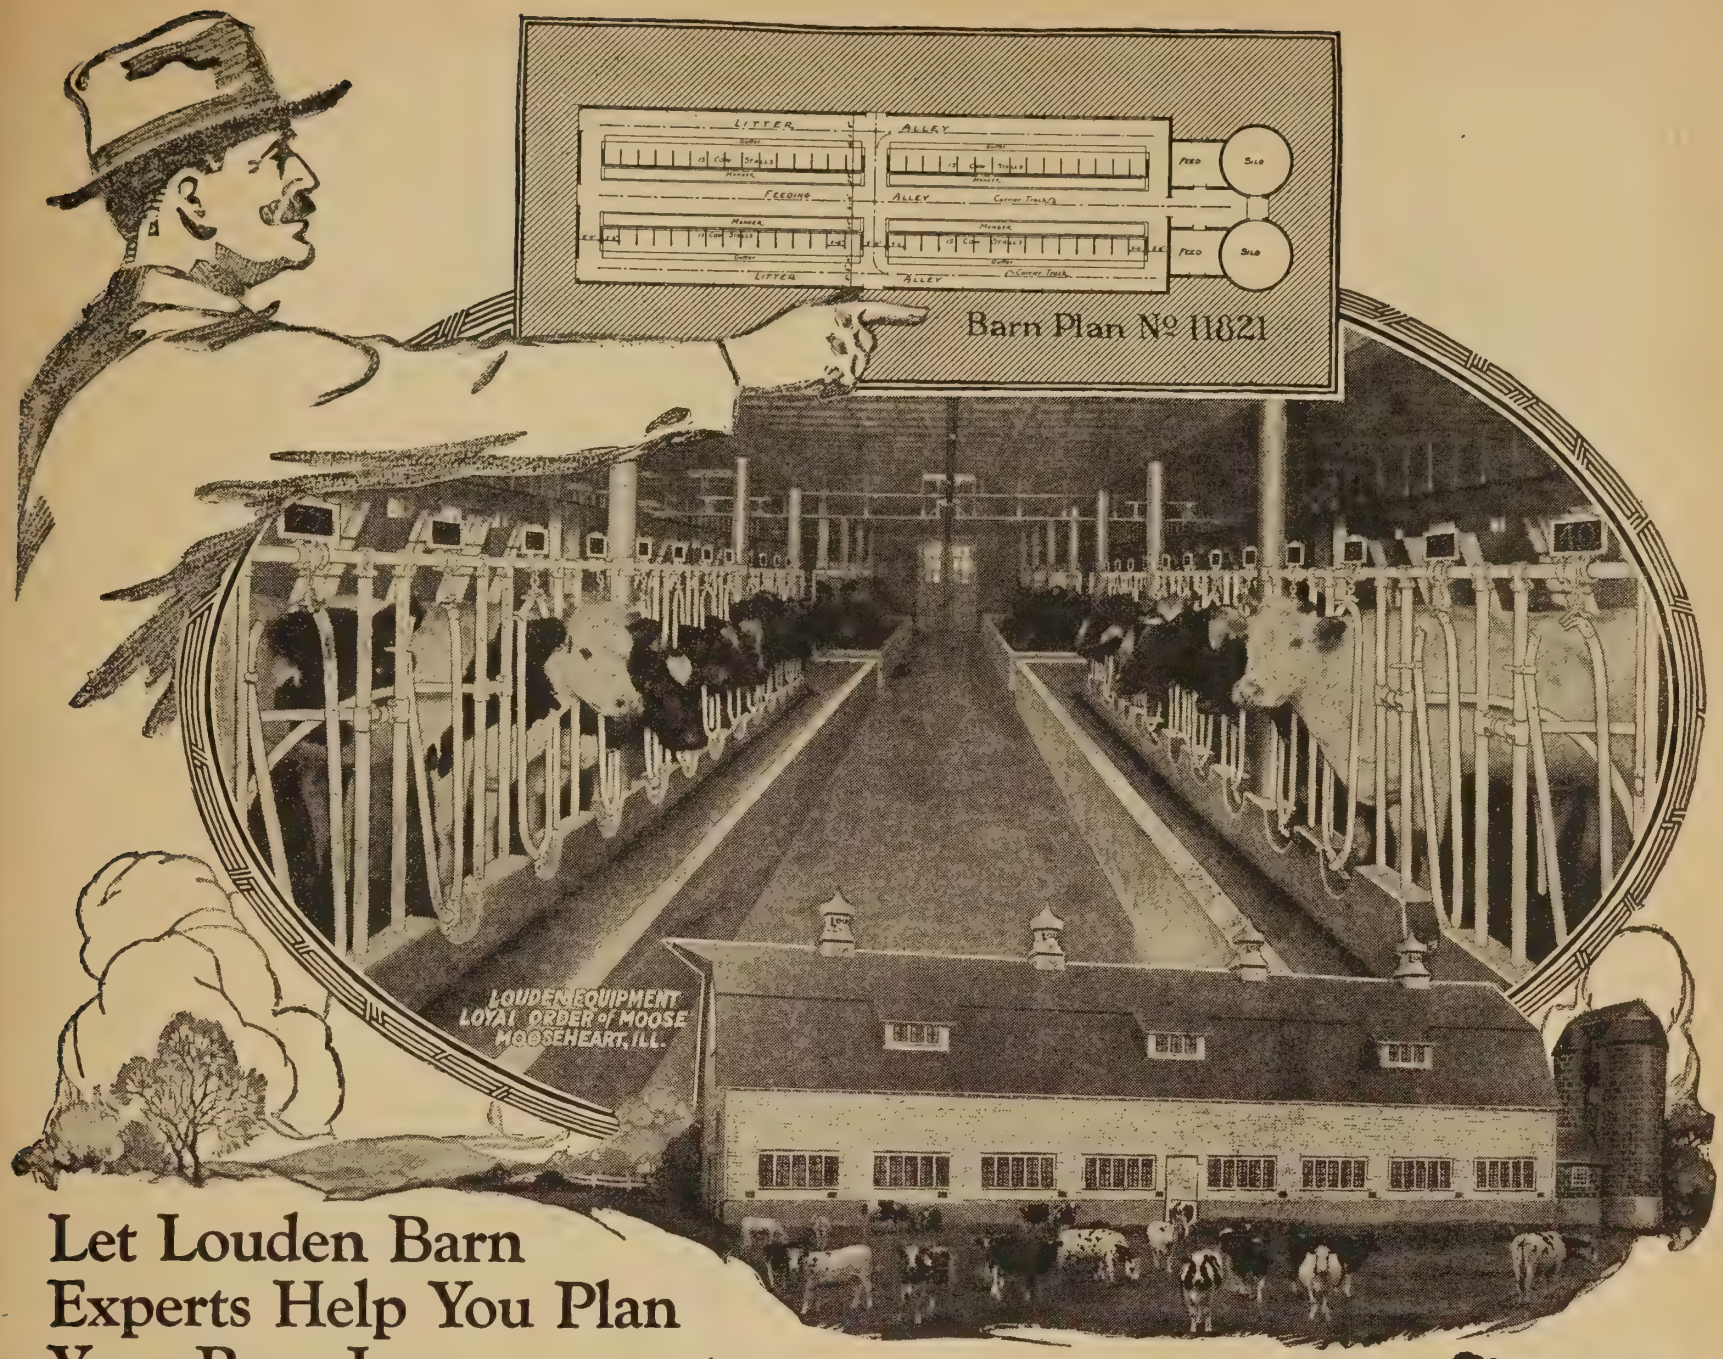
4 Yearlings, 7-4 to 6 months old
$100.00 and up if taken soon

All sired by 30-pound bulls. Out of A. R. O. dams with records made on the farm running from a 17-lb. two-year-old to 21-lb. two-year-old, and aged cows from 22 to 30 pounds. We have 13 granddaughters of King of the Pontiacs in our herd and one of his sons out of a 30-lb. dam. Also a grandson of Pontiac Korndyke out of 1,105-lb. dam, 30 pounds, 7 days.
C. A. PARKS, Mgr. **Assumption, Ill.**



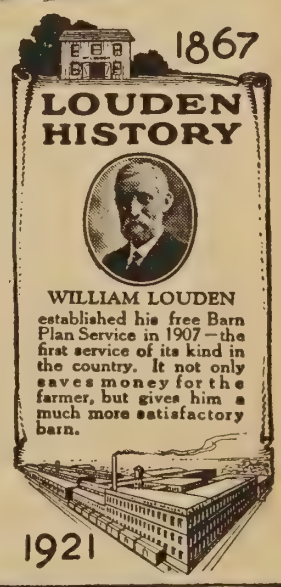
Prices for Butter and Cheese in 1920

Butter prices averaged one cent a pound higher in 1920 than in 1919, while cheese took a drop of about four cents. Butter took a lead of six cents in January, increased it to 13 cents in February, but from February on there was a decline until the September price showed about the same as for the previous year. The next three months were those of rapidly declining prices, averaging eleven cents a pound less than for the corresponding three months of 1919, with the December drop amounting to seventeen cents.

Cheese has not been quite so erratic in price, but it has shown a decline in practically every month and the December price is nine cents under that prevailing in January. Because of lowered supplies, the cheese market is presumed to be in somewhat better condition than a year ago. In the butter market receivers are predicting still lower prices and ask producers to be prepared for pre-war prices before the flush production season of 1921.

From month to month during the past year we have published the

Seventeen Nebraska counties have been canvassed for members in the Nebraska Farm Bureau Federation, the canvass ending December 18th. A total of 15,000 members had been signed to that date, the average per county being 852.



Let Louden Barn Experts Help You Plan Your Barn Improvements

Regardless of whether it is to be a small or large barn, a remodeled or new barn, you want to hold down the cost of material and labor to the lowest possible figure. At the same time you want to build so that your needs will be fully met for years to come. This is where Louden Barn Plan Service comes to your aid. It does away with costly and trouble-breeding guesswork. It gives you the benefit of the most advanced thought and practice in barn construction and arrangement—a well balanced barn in which every detail is made to contribute its full share toward the daily saving of chore work, convenience and the comfort and health of the stock.

We maintain the strongest organization of barn building specialists in America for the chief purpose of aiding dairymen and farmers in solving their barn building problems. Louden plans are not the "ready-made" kind, but are specially worked out to meet your own particular requirements. Write us what kind of barn you have in mind, the number and kind of livestock to be housed. Our barn experts will work out a plan with suggestions that will exactly fit your conditions and send you blueprints of it. No charge or obligation.

And after you have carefully considered the plan of constructing your barn, let us show you how Louden Labor Saving Barn Equipment will save you many a dollar in running it—for years to come.

Louden Equipment Saves Half the Barn Work

Louden Stalls and Stanchions save time and labor in handling cows morning and evening, besides giving the herd real pasture comfort in the barn. And with the Louden Built-Up Manger Curb you save many a pound of feed that would otherwise be wasted. Louden Litter Carriers make a boy's play out of an otherwise hard and disagreeable job—make barn cleaning a matter of minutes instead of hours. Louden Feed Carriers bring the feed for twenty cows at a single trip. Louden Detachable Water Bowls do away with that disagreeable chore of turning the cows out to water during bad weather, and, better yet, they increase the milk yield almost unbelievably.

Get These Two Helpful Books

The big Louden Catalog will show you the simplicity, strength, and durability that have made Louden Barn Equipment throughout all these years the preferred equipment among farmers the country over. This big book shows Stalls and Stanchions, Manger Divisions, Animal Pens, Feed and Litter Carriers, Water Bowls, Ventilators and Cupolas, Barn and Garage Door Hangers, Hay Tools, Power Hoists—"Everything for the Barn."

The Louden 112-page Barn Plan Book is chock full of information every barn builder should have. Plans and pictures of 74 different barns are shown. In addition, there are chapters on mixing and using concrete, roof construction, lighting, ventilation, barn arrangement, and hundreds of other points of vital interest to barn builders. If you are planning to build or remodel a barn within the next year, don't fail to get this book at once.

Mail the coupon today. No charge—no obligations

LOUDEN

BARN PLAN SERVICE *and* EQUIPMENT

A healthy Holstein, this. She is a 3-year-old junior champion, with a seven-day score of 581 pounds milk; 29.3 lbs. butter fat.

Keeping Tabs on Health Pays

THE whole scheme of profitable dairying leads back to the subject of health. No way of escaping it. A cow is profitable or not, according to the degree of vigor of her milk-making organs.

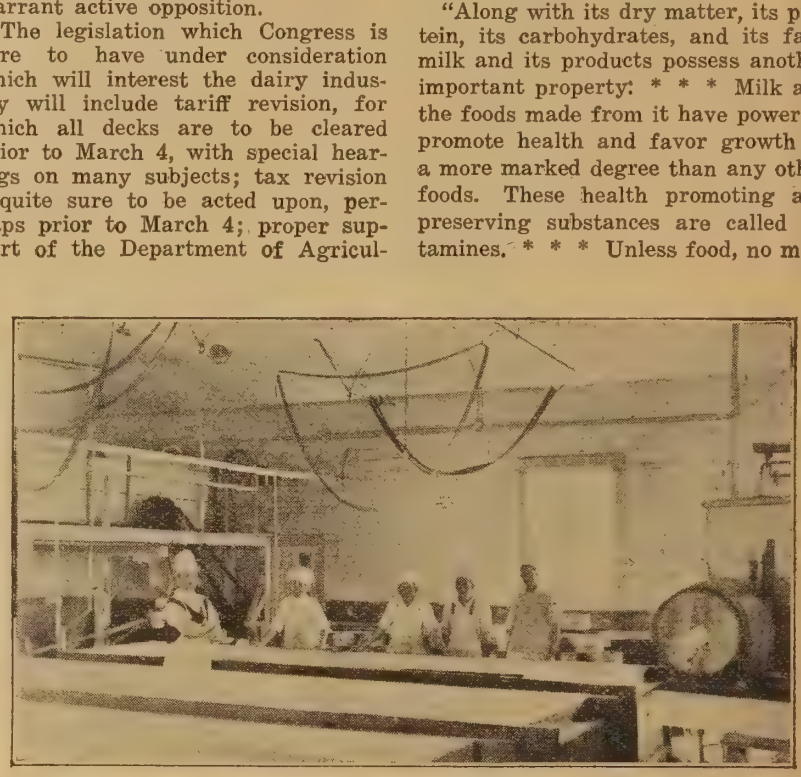
Watch the milk-yield closely; it's the barometer of health. Reduced milk-flow means the presence or approach of disease.

Each year more thousands of dairy farmers are learning the value of the simple Kow-Kare home treatment—both as a preventive and reliable aid in relieving diseases of the genital and digestive organs. Barrenness, Abortion, Retained Afterbirth, Scouring, Lost Appetite, Bunches can be kept out of your dairy with the aid of this great cow medicine.

Give Kow-Kare a trial; feed dealers, druggists and general stores sell it—70c and $1.40 packages. Write for free book, "The Home Cow Doctor."

DAIRY ASSOCIATION COMPANY
Lyndonville, Vermont

NOTE: The trade-mark name has been changed from KOW-KURE to KOW-KARE—a name more expressive of both the PREVENTIVE and CURATIVE qualities of the remedy. There is not the slightest change in formula or manufacture.



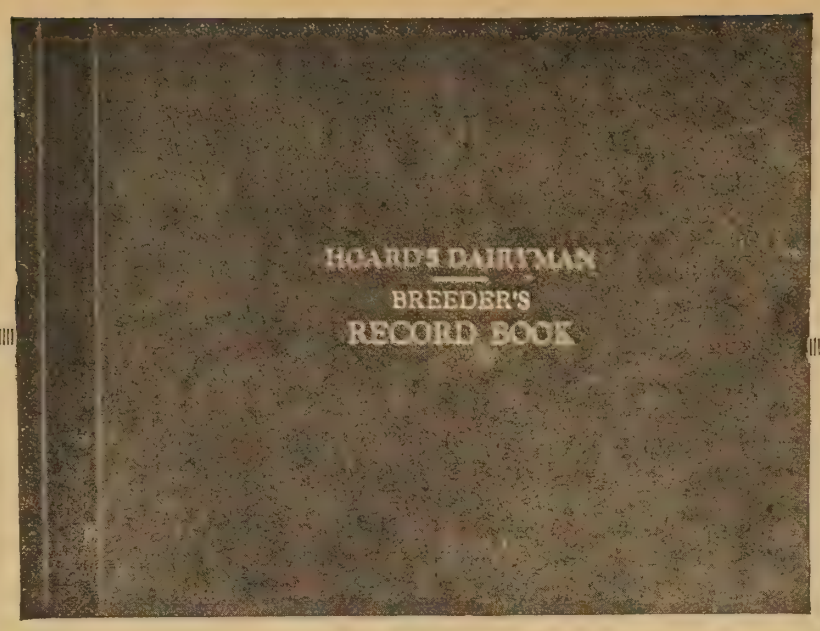
The National Dairy Union

(A Union of the Allied Dairy Interests)

With Congress again in session, to end March 4, and then resume in Special Session soon thereafter, dairy interests will need to exercise constant watchfulness against antagonistic legislation. Public statements which have been made by representatives of the margarine industry and bills now pending in the House indicate that efforts will be made if possible to modify the present safeguards against the illicit sale of margarine for butter. The Calder bill S-3011 providing for the supersedence of federal regulations covering the labeling of foods and drugs sold in packages in interstate trade over the laws of the states where final sale is made, is not approved by dairy officials in the chief dairy states, and seems to warrant active opposition.

The legislation which Congress is sure to have under consideration which will interest the dairy industry will include tariff revision, for which all decks are to be cleared prior to March 4, with special hearings on many subjects; tax revision —quite sure to be acted upon, perhaps prior to March 4; proper support of the Department of Agriculture, including special appropriations for the dairy division—all of which need support at this time, and also amendments to the pure food and drugs act, and special oleomargarine legislation proposed by friends of the oleo interests. A tariff on oriental oils is of special interest, and will be made up for special hearings in January or February.

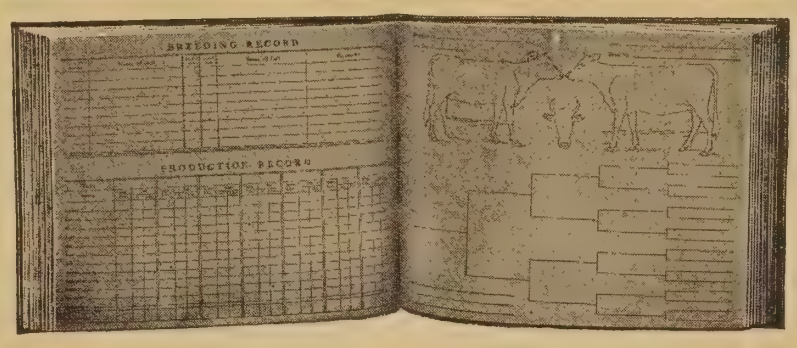
In a recent circular, evidently designed to establish a basis upon which to ask for the repeal of the oleo color tax law, on the alleged ground that it harmed agricultural interests, J. S. Abbott, Secretary of the Institute of Margarine Manufacturers, says that if the margarine industry has been responsible for a decreasing consumption of butter it "deserves the thanks of humanitarians everywhere". Dairymen will need to think over this state of mind. Mr. Abbott also says that "The slogan 'Down with margarine', which has been the cry of a few hopelessly envious souls, is insane and without a sound economic or scientific basis", and that "it will be a boomerang to those who have used it as soon as the facts of margarine as a food are known". This is humorous, although Mr. Abbott probably did not so intend it. "Margarine as a food" has the exact value of beef fat, or pork fat, according to the scientists of the Office of Home Economics of the Department of Agriculture. Flavoring and coloring it to imitate butter, and calling it oleomargarine, in order to make it bring a butter price in the market from those who don't know the food value, is all there is to the problem. The National Dairy Union will glady enlist the services of Secretary Abbott to make the facts known—providing he will make all the facts known.



A TILLAMOOK CHEESERY

This shows the interior of one of the factories in the famous Tillamook cheese country, where co-operation to porduce quality succeeds. Last year the output of this factory was 719,683 lbs. cheese. The photograph was taken by Reed Ferris, one of the cheesemakers.

The Washington office of the National Dairy Union is continuing its study of the school and college text books, to determine those which tell the truth on this subject. No wonder oleomargarine is found on so many tables when the books which are used in the schools omit all reference to the great food principles included in butter, which must be sought in every diet. Occasionally, however, there comes a ray of light. For example, this from the new work, "Agriculture for Beginners", recently issued by Ginn & Company:



"Along with its dry matter, its protein, its carbohydrates, and its fats, milk and its products possess another important property: * * * Milk and the foods made from it have power to promote health and favor growth in a more marked degree than any other foods. These health promoting and preserving substances are called vitamines. * * * Unless food, no matter how good otherwise, contains these vitamines, it does not nourish the body nor preserve bodily health as it should. A complete lack of vitamines in our food would cause death. Since, then, milk and its products, butter, cheese, curds, are rich in vitamines, these health giving and health preserving foods should form a regular part of a person's diet."

The campaign for the adequate financial support of the work of the National Dairy Union is now going on, and is meeting with good success. A personal letter, telling briefly the activities under way and the work contemplated, has been sent to the individuals and concerns interested in ice cream, butter, and cheese making, and to others interested in the work, and the response is very encouraging. All financial support should be sent to George Caven, the treasurer of the National Dairy Union, 136 West Lake Street, Chicago, Ill. Suggestions as to the work being done, comments of any kind, and especially information as to the character of the text books being used in the schools, the literature being sent out by state institutions, false or misleading advertising appearing in the interest of substitutes for dairy products, will be gladly received by the Secretary, A. M. Loomis, 303 Seventh Street, N. W., Washington, D. C.—NATIONAL DAIRY UNION.

Wanted—Married farmer who thoroughly understands general farming and modern equipment. Excellent living conditions and steady year round position to right man. Reply, state wages, references and experience. BOX 232, New Castle, Pennsylvania.

British Milk Questions

HOARD'S DAIRYMAN:—At each of its annual gatherings one of the most popular sections of the Royal Agricultural Society's show is the working dairy. The spectacular aspect, however, is a secondary consideration, and much useful work is undertaken apart from its primary function of doing what is needful in connection with the milking trials and butter tests. The report of the steward of dairying accordingly generally contains some interesting information apart from the details and summary of these tests.

Mr. Mathews, in his report of the work at the Darlington show, gives particulars of interesting experiments dealing with factors affecting the quality of milk. These experiments do not bring to light anything that is new, but they emphasize points that dairymen must keep in mind if they are to escape trouble. In the first experiment two churns were filled with milk, which was allowed to stand for four hours, when samples were taken by a sampling tube from the bottom of the churns, from the middle, from the top, and from the whole of the milk in each churn.

The fat contents in the bottom samples were 1.4 per cent and 2.5 per cent, in the samples from the middle 3.55 per cent and 2.75 per cent, in the top samples too much to be read on the Gerber tester used, while the whole churns tested 5.55 per cent and 4.925 per cent respectively. This shows the danger of drawing milk off the bottom of a churn, as by a tap, without using a plunger thoroughly to mix the milk, a danger that may equally well arise by drawing off from the top of a churn without adopting similar precautions, and leaving the impoverished milk at the bottom for subsequent delivery.

The second experiment dealt with the first and last milk drawn from cows at the same milking. A Shorthorn and two Channel Island cows were used in the experiment. In the case of the Shorthorn the first drawn milk contained only .06 per cent of butterfat, but the last drawn had too much fat to be read, while the mixed samples contained 5.60 per cent. In the first Channel Island cow the first drawn milk contained 1 per cent of fat, the last drawn too much to be read, and the mixed samples 6.35 per cent. In the case of the second Channel Island cow the last drawn milk again contained more fat than could be read on the Gerber tester, the first 1.30 per cent and the mixed samples 5.50 per cent.

This emphasizes the importance of clean milking to maintain the quality of milk. It is pointed out that the milk in the cow's udder is in much the same position as in the milk churn that has been standing for a time drawing the first of the milk to sell and leaving the rest for a calf and drawing milk from the bottom of a churn are equally prejudicial to the purchaser unless the milk has been well mixed. In the churn this can be accomplished by the use of a plunger, but in the case of a cow a fair sample can only be obtained by clean milking.

When trouble arises with milk the cause is frequently difficult to detect. It may arise from the water supply, from the utensils, or when the milk of a herd is mixed, as it generally is, abnormal milk from one cow will destroy the value of that from the whole herd. In investigating trouble, unless there is some general cause that seems to be indicated, the first step is to discover whether it arises from the milk of any particular individual in the herd. In the case of ropy or stringy milk, for instance, this ordinarily takes a considerable time, for developments must be awaited in samples taken and set aside. By the brom-cresol purple test, which is very easy to apply, abnormal milk can be detected quickly, and may be traced not only to a cow but to a particular quarter of her udder.

At Darlington Captain John Golding, of the Dairy Research Institute, conducted a series of tests with the object of discovering any variations that might appear in the reactions of freshly-drawn milk from different breeds of cows. The test, as probably readers of Hoard's Dairyman may be aware, consists in adding 3 cubic centimeters of milk to one drop of a saturated solution of brom-cresol purple in water placed in a small tube. With normal milk a bluish-grey color is produced, and if the color varies appreciably from this an abnormal milk is indicated. Trials have indicated the value of the method of detecting abnormal milks, and the colors do something to indicate the nature of the trouble. In the investigations at Darlington the limits of variation, apart from three samples, fell within the normal variation, and the causes of these extreme variations could not be traced in the showyard. The test evidently has considerable possibilities and may prove of great value to the cheesemaker. Abnormal milk in the cheesemaking dairy may ruin the produce for weeks or months—indeed, until the trouble is located and removed. Minor milk troubles, often difficult to detect, may, without holding up cheesemaking, depreciate the value of the produce, and anything that can indicate quickly and simply an abnormal condition of milk is likely to interest all dairymen, and especially cheesemakers.

In the milking trials only two cows were disqualified for giving milk containing less than 3 per cent of fat on the average of the two milkings, although if the fat percentage had been taken on each milking it is pointed out that 27 cows would have been ruled out. The average results from the various breeds show that South Devons did best with 72.59 points, but only two of this breed competed. The eleven Lincoln Red Shorthorns had an average of 70 points, and Shorthorns with 76.98, and Friesians with 67.23 were close up. Small breeds follow in the Ayrshire with 66.18 points, the average for three, and the seventeen Jerseys averaged 66.13, a remarkably good performance for a breed more famed for butter than for milk. The average butterfat content, 4.89 per cent, did much to give them their position.

The best yield of butter was from two Ayrshires competing in the butter tests, which averaged 2 lbs. 3¼ ozs., but the twelve Jerseys in the section over 900 lbs. live weight gave considerably the best average of points gained with 38.40. It took 22.30 lbs. of this Jersey milk to make one pound of butter, and other breeds exceeding 900 lbs. varied up to 31.10 lbs. milk to a pound of butter. The six Jerseys under 900 lbs. averaged a pound of butter from 20.74 pounds of milk, which is nearer the ratio that might be expected from this Channel Island variety.

England. THOS. REECE.

Permanganate Solution

How strong should a solution of potassium permanganate be used for flushing purposes? Could there be any evil results in using the solution too strong and what would the results be? What is the best form of potassium permanganate to buy for flushing purposes?

Gladwin, Mich. H. G. B.

We recommend a very mild, non-irritating solution of 30 grains of permanganate of potash per gallon. A strong solution may cause severe irritation, indicated by straining. Buy crystals of permanganate of potash in preference to the powdered drug.

DON'T LET YOUR COWS ABORT

Take no chances of losing calves, cows and milk profits from Contagious Abortion. If it has attacked your herd, get rid of it at once. If you have escaped so far—KEEP IT OUT.

ABORNO

THE GUARANTEED REMEDY FOR CONTAGIOUS ABORTION

Treats this disease scientifically through injections into the blood which kill the abortion germs and immunize healthy animals against them. Can't harm the cow. Has wonderful record of success. Prompt and positive in action—reasonable in cost.

Write for free booklet with guarantee and letters from farmers and dairymen

ABORNO LABORATORY
28 Jeff St. Lancaster, Wis.

Don't Wear a Truss

Brooks' Appliance, the modern scientific invention, the wonderful new discovery that relieves rupture, will be sent on trial. No obnoxious springs or pads.

Mr. C. E. Brooks

Brooks' Rupture Appliance

Has automatic Air Cushions. Binds and draws the broken parts together as you would a broken limb. No salves. No lies. Durable, cheap. Sent on trial to prove it. Protected by U. S. patents. Catalog and measure blanks mailed free. Send name and address today.

Brooks Appliance Co., 467 B State St., Marshall, Mich.

Bone Spavin

Even established cases yield to Fleming's Spavin and Ringbone Paste, or money back. $2.08 a bottle postpaid. Send for FREE Vest-Pocket Veterinary Adviser. Describes Spavins and 200 other horse and cattle ailments.

FLEMING BROTHERS, 255 Union Stock Yards, Chicago

NOW

is the time to purchase a silo, have it shipped early and haul in the winter on good roads. CORN BELT hollow tile silos thoroughly and beautifully glazed are permanent, fireproof, paint proof, repair proof. Include tile chute, tile feed room, steel back ladder and hip roof rafters. Special discounts for early shipments.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Contagious Abortion

Premature expulsion of a dead or live fetus almost invariably is caused by a specific micro-organism known as the bacillus abortus of Bang. This germ causes an infectious disease, the result of which is abortion and to the same cause may be attributed retention of the afterbirth, "shy breeding", barrenness, and systemic debility of some new born calves that fail to survive or thrive. All of these, therefore, correctly may be embraced in the general term "abortion disease". Some of them occasionally may be due to some other cause, but usually the bacillus abortus is the cause. White scours or "calf cholera" and pneumo-enteritis are closely associated with the abortion disease.

When the bacillus gains access to the womb it grows apace, causing an abnormal or diseased condition in the cavities or crypts of the cotyledons or buttons of the womb through which nutriment goes to the fetus. The result is that the fetus suffers more or less. If separation takes place between the maternal and fetal membranes the fetus dies and is expelled, or it may be retained and mummify in the womb. Oxygen is another necessity of the fetus derived from the dam's blood by way of the cotyledons. Lack of it and nourishment cause death; inadequate supplies may partially starve or poison the fetus, but not cause death. Where that occurs the calf is born weak, readily succumbs from debility, or as readily contracts navel infection, leading to abscesses (pyemic arthritis), infectious dysentery or white scours, or pneumonia and bowel disease (pneumo-enteritis). Retention of the afterbirth is due to adhesions between the villi or projections of the placental membrane and the cavities or crypts, of the cotyledons, or wedging there, due to engorgement with blood. Sterility or barrenness results from the germ infection inducing an unhealthy condition of the lining membrane of the womb, (endometritis) while pus forms following retention of the afterbirth and constitutes pyometra. That, however, may also be due to other sources of infection.

Every case of contagious abortion disease is due to a previously existing one which furnishes the germs or "seed" of the malady. An affected cow is, therefore, the source of germs. They are present in her discharges and these contaminate feed or water which communicate the infection when consumed by clean or susceptible cows or heifers.

The disease may also be communicated by a bull after service of an affected cow, or a cow may infect her vagina with the germs by lying upon a floor or ground contaminated by the discharges of an affected cow and possibly by switching such discharges from the floor or gutter onto her external genitals. When this occurs the womb in time becomes infected, and the infection may spread to the Fallopian tubes and ovaries.

The bull is less often a communicator of abortion disease than is generally supposed, but the possibility of infection from him must be taken into account and prevented. There is some evidence to show that the milk of an infected cow, containing virulent germs of the disease, may communicate it to calves fed on such milk. That, too, must be kept in mind when carrying prevention measures into effect.

Obstructed Teat

I have a Jersey cow with third calf two weeks old and her left front teat has almost grown shut. It is hard to get any milk out of it.
Marshall, N. C. P. V. R.

Sterilized dilators should be used to increase the caliber of the duct of the teat. A dilator of the glove-stretcher pattern is most useful. Your veterinarian may have one on hand. If such a dilator inserted and opened over and over again several times a day does not suffice it will be necessary to slit down through the obstructions in four different directions, by means of a teat bistoury, and then strip away a little milk frequently during the healing process.

Lump on Jaw

I have a young Holstein calf that has developed a lump on the side of his jaw. It grew very rapidly and is now about two inches round and an inch thick. Could this come from the teeth? The calf eats nice and is doing well.
Jefferson, Wis. R. N.

The teeth should be examined, but it seems unlikely that they are the cause. In cases of this sort we sometimes find a wad of feed lodged between the teeth and cheek and that is easily removed. A bruise would be a likely cause, if no foreign body is found present and if so it would be well to paint the lump with tincture of iodine twice daily. If it softens, open it to liberate pus and then apply iodine now and then until healing is complete.

Prolific Cow

I have a grade Jersey cow that had 4 calves in 11 months during the year 1920. She dropped two January 18th; came back with two December 5th. Isn't this something unusual?
Clifton, S. C. L. E. W.

In the first place it is unusual for a cow to have twins and to have two lots of them in one year is phenomenal. The heifer twinned with a bull usually is barren and is termed a "free martin". Twin bulls and twin heifers are fertile. The bull twinned with a heifer is also fertile. The barren free martin heifer is hermaphroditic.

Abortion Disease

Kindly advise me if there is any form of contagious abortion that keeps cows from getting with calf. We have a number of cows that we cannot get with calf. They calved last spring and not one of them has ever lost a calf.

We had a cow lose a calf about 7 months old, and then raised her next one, and then lost the third. Since then she will not get with calf. Could it be possible that she has some disease which has spread through nearly all the herd?
Hamilton, Mont. D. C. G.

The contagious abortion disease is the commonest cause of shy breeding and barrenness as it is of premature expulsion of a live or dead calf and retention of the afterbirth. A cow tends to become individually immune after aborting several times but remains infected although she carries a calf the full time and so infects other cows or heifers. The bull serving such a cow may communicate the disease to other cows he serves, unless his sheath is well disinfected before and after each service. This is done by injecting into the sheath lukewarm water containing permanganate of potash or some other mild antiseptic prescribed by a veterinarian. A like solution is used to flush out the vagina of a cow that has aborted and to disinfect the vagina of each cow or heifer that is to be bred. After abortion the womb of the cow should be perfectly cleansed and disinfected by a trained veterinarian and he will also treat the ovaries of cows that fail to come in heat or conceive when bred. See other recent answers on the subject.

Contagious Keratitis

Kindly tell what is the matter with my yearling bull. His left eye had a small white spot in the pupil and which spread nearly all over the eye. I blew the eye full of fine salt and now it is getting a little better and the sight in that eye is coming back, but now the right eye is going the same way.
Clyde, Tex. W. H. A.

This disease usually is called "pink eye" and being due to germs is infectious and often quickly infects all cattle in the herd. Keep the affected animal isolated. Treat by bathing eye with a saturated solution of boric acid twice daily and once daily putting a little bit of one per cent yellow oxide of mercury ointment between the eyelids, then closing them and massaging to spread the salve. If there is much discharge from the affected eyes it is better to put a drop of 25 per cent solution of argyrol in the eye every three or four hours and then use the ointment when discharge has subsided.

ABORTION IN CATTLE

CAN BE TREATED SUCCESSFULLY AND YOUR COWS MADE PROMPT, REGULAR BREEDERS BY

STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for **FREE BOOK**, It explains the causes and symptoms of Abortion and tells how to treat Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. PRICE $1.00 plus 4c tax. Mailed Postpaid, in plain wrapper.

Lubricating the Tractor in Cold Weather

(Continued from page 1110)

brication; that is, there are different methods of delivering oil to the various moving parts of the tractor, truck, and automobile engine. These systems also have a direct bearing on the question of the type of oil which is best suited to a particular engine. Take, for example, the splash system of lubrication in which the oil is thrown to the various parts of the motor by moving parts such as the fly-wheel and the bottom end of the connecting rods as they revolve. This type of lubricating system requires a somewhat thinner grade of oil than could be used with the full force feed system where the oil is forced by a pump through channels under fifteen to thirty pounds pressure to the various bearings of the motor. In the light of these facts it is highly desirable for anyone to look into the matter of lubrication thoroughly. It does not cost any more for correct lubrication than for incorrect lubrication. Those motors which use a full force feed system of lubrication usually have the piston fitting a little tighter in the cylinder than those using some other type of lubricating system; therefore, the use of an oil which is too thin in this type of motor might cause too much oil to work by the piston into the combustion chamber and foul the spark plugs, thus causing delays and no end of trouble. The tractor manufacturers do not hesitate to say that incorrect lubrication is one of the greatest difficulties in the maintenance of their tractors.

Bettering Spartanburg With Butter

HOARD'S DAIRYMAN:—A survey of Spartanburg, S. C., shows that 500 to 700 pounds of creamery butter is consumed in and around the city every week. The survey also shows that very little country butter was being made to supply this demand and even that little was of inferior quality.

Miss Elizabeth Forney, state agent in dairying for the home demonstration force, being a woman and therefore naturally inquisitive, asked, "Why can't we improve the quantity and the quality of our country butter so as to help meet this big demand?" The outcome was a "butter contest", in which the women of the community showed very marked alertness and responded remarkably well.

Starting out with a series of instructive articles in the local newspapers to give publicity to the idea and to present the food value of butter, the contest was begun May 1st to be continued six months in order that the period of the contest might embrace spring and summer and fall. The contest was begun with 16 demonstrations in better butter making by Miss Forney. Over 400 women and girls attended these demonstrations.

Through the liberality of local banks and interested individuals, prizes totaling $275 in value were offered. Ninety-four women entered the contest, which meant that they would send to the office of the Home Demonstration Agent once each month for six months one pound of butter made to be scored by a dairy specialist. At the first judging of butter the average score was 91½ and the judge pronounced it as fine a lot of butter as he had ever tasted. As the scoring of the butter progressed at this first judging, the women sought information by questions on feeding and other matters of importance in their work. To aid in the "dairy education" of the contestants there were on display various dairy utensils showing contrast between old and new and emphasizing efficient methods and improved processes.

At the second judging late in June the number of contestants sending in butter was even greater, and the highest score was 96. An evidence of the outside interest aroused even at these first two judgings is the fact that all of the contest butter was sold for a fancy price. One contestant told of a customer to whom she had sold butter for several years, voluntarily offering her 10c more on the pound. One of the demonstration clubs supplied the summer school at Converse College with 12 to 18 pounds a week.

The final judging, the climax of the contest in interest and enthusiasm, was held at the Spartanburg County Fair November 1st, and even though the last period of the contest is considered the beginning of the off season for butter in this territory, the highest score was 93. This butter contest and the educational exhibits accompanying it constituted a special feature of the county fair which attracted very wide interest. The exhibit showed, among other things, the comparative value of dairy products and included four groups of foods having as their center milk, butter, cheese, and cream with their equivalent value in other foods. The display was arranged in a long show case and was viewed by probably 50,000 people.

Final figures of the scoring of the contest showed the highest single score 96, the lowest 82; the highest total score 559.10, and the lowest 533.5; and the highest average score 93.16. The winner of the first prize in the contest was Mrs. R. W. Foster, the prize consisting of a registered Jersey heifer. Mrs. Foster, in expressing her appreciation of the privilege of having been one of the contestants, summed up the value of the contest, at least so far as the individuals are concerned, when she said: "If no prizes at all had been won, the work of the contest was unlimited in its beneficial results."

At the conclusion of the contest Miss Forney remarked: "We certainly have buttered Spartanburg County." She might with equal force have remarked: "We certainly have bettered Spartanburg County."

South Carolina. A. B. BRYAN.

The Healthy Cow, the Hungry Cow is the Business Cow

She's the cow that will convert her feed of grain and fodder into pails of milk.

Remember, the better the appetite, the greater the food consumption, the greater the milk production. Hence, good health, a strong appetite and good digestion are the absolute essentials of a big milker.

Dr. Hess Stock Tonic

Keeps cows healthy. It makes cows hungry.

It contains Nux Vomica, that greatest of all nerve tonics. It whets the appetite, brightens the eye, invigorates the system. It contains Quassia, that bitter Stomachic tonic that produces appetite. It contains Iron that helps to replenish rich red blood, so essential to a cow in milk.

Lastly, but just as important is it—it contains Laxatives and Diuretics that cause the kidneys to filtrate and the bowels to operate regularly, so as to throw off and carry off the waste material. There is no clogging of the system where Dr. Hess Stock Tonic is fed.

Good alike for cattle, horses, hogs and sheep. It keeps animals healthy, the whole herd thrifty. It expels worms. Always condition your cows for calving with a course of Dr. Hess Stock Tonic before freshing.

Dr. Hess Stock Tonic is compounded strictly on scientific lines. You buy it according to the size of your herd. Tell your dealer how many cows you have. He has a package to suit. We guarantee good results in the milk pail.

25 lb. Pail, $2.50 **100 lb. Drum, $8.50**

Except in the far West, South and Canada. Smaller packages in proportion.

DR. HESS & CLARK **Ashland, Ohio**

Dr. Hess Dip and Disinfectant

Keeps the Dairy and Stables Healthful and Clean Smelling

Junior Dairy Show at South St. Paul

(Continued from page 1134)

vidual is almost faultless back to her rump, but is a trifle high at the tail setting. Contendors were: Geo. Hannay, Leighton Vermilyea, Clarence Troug, Robert Boneham, Pearl Smith, Geo. Dunn, Floyd Vermilyea, and Eddie Anderson.

The Guernseys were next out and Verne Stiehl was not t be denied first place on his Lassie of Maplewood. This beautiful heifer stood 5th in a class of thirty entries at the National Dairy Show. Possessing wonderful breed type and straight lines and carrying an abundance of constitution and ruggedness with quality she was later made the grand champion of the Show. Second place went to Ruby Conklin on a granddaughter of Ladysmith's Cherub, a very typy calf showing lots of quality, but not quite the ruggedness of the Stiehl heifer. Third was awarded to Einar Larson, fourth to Pearl Conklin, fifth to Robert Frissell, and 6th to Verne Reese of Park Rapids. The placings in this class were close with only the winner a trifle outstanding. Only two grade Guernsey calves were shown, first going to a beautiful heifer shown by Donald Brooks and second to Helen Davis.

One Brown Swiss entry was made by George Minnette of Sauk Center. This animal was one of the best fitted individuals of the show. In the championship class the Brown Swiss entry, Monica Zurn's first prize Holstein, and Verne Stiehl's Guernsey fought it out for championship honors. Quality, fitting, and breed type characteristics were sufficient to put the fawn and white a trifle ahead of her competitors.

Minnesota. L. V. WILSON.

Junior Letters

Hoard's Dairyman Juniors:—I am 11 years old and in the 7th grade at school. I have about 10 Bantam chickens and about 15 rabbits. I milk two cows night and morning. I like to milk cows.

If any of the juniors wish to write to me my address is R. F. D. No. 2, Rupert, Ida.

Merrill Baker.

Hoard's Dairyman Juniors:—We have 17 cows and 5 calves, including two pure-bred Guernseys, one Holstein, and two other calves.

My father is president of the Guernsey Club of Tillamook, Ore., and before we lived on the farm he was county clerk of Tillamook County.

I am 12 years old and in the 7th grade and soon will be in the 8th grade.

We run a milk route in town and deliver about 120 quarts and about 25 pints of milk and we go every day at 4 o'clock.

I wish some of the juniors would write to me. My address is Box J. Tillamook, Ore.

James Harrison.

Hoard's Dairyman Juniors:—I am 14 years old and out of school. I left school last June. I live on a farm of 125 acres. We had two acres of potatoes and about five of corn. We keep around thirty head of cattle the year around. We are milking 8 cows now. One cow freshened about a week ago. There are just two of us to run the farm. We have a silo that is 12x28 feet.

I would like to hear from some of the juniors. I will answer all letters received. My address is Cavenlish, Vt.

Delbert T. Kingsbury.

Hoard's Dairyman Juniors:—I live on a 180-acre farm. We milk 16 cows and we also have 12 heifers.

Wishing the juniors good luck.

If any of the juniors wish to write to me my address is R. F. D. 3, Remsen, N. Y.

Margaret Jones.

Hoard's Dairyman Juniors:—I live on a 272-acre farm. It is all under cultivation except forty acres of woods and pasture. We raise pure-bred Holstein-Friesian cattle. We started with the pure-breds three years ago and we like it fine. Before we started we had 30 milking scrubs.

My father gave me a heifer calf in January. I feed it ground oats, corn, oil meal, and hay. We took two calves and three cows to the County Fair and got four first prize ribbons, one second, and two third.

I raise Flemish Giant rabbits and have some for sale that are two months old.

We have two tractors and one is for sale. We also have six horses.

I am fourteen years old and in 1st High.

Minnesota. Fred Uitdenbogerd.

Hoard's Dairyman Juniors:—I received the fob, creed, and button and think they are fine. I am 12 years old and live on a 170-acre farm. My father and I are all alone as my mother has gone away. We are milking 16 cows and I milk six. I go to school and I am in the 7th grade. I am the best scholar in school. I was in the 5th grade last year. Wish some of the juniors would write to me. My address is Bloomville, P. O. Box 11, New York.

Walter Warmuth.

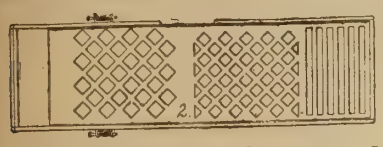
Inventions and Appliances of Interest to Agriculture

Self Feeder

The special features of this feeder are: first, the hopper fronts, which can be adjusted in or out to regulate the flow of feed; second, the trough covers, which the hogs must lift to

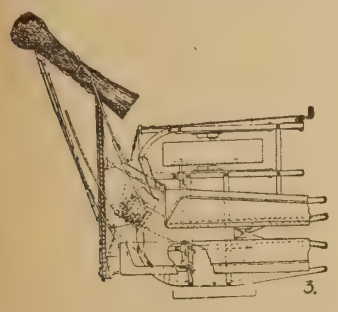


feed; and third, the folding steps, which prevent waste of feed.

(Charles Burnett Washington, Ohio, U. S. Patent, 1,344,789.)

Potato Grader

The potatoes start at the right of this grader, and move to the left when it is agitated. The very small potatoes and dirt drop through first, then the larger and larger potatoes,

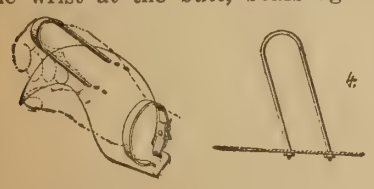


and finally the largest drop from the left end.

(Charles Jenkins, Delavan, N. Y. U. S. Patent, 1,345,858.)

Harvester

The improvement on this corn harvester is in the discharge mechanism. This has a conveyor chain which discharges the bundles in a position parallel to the line of draft, and so far from the harvester that the horses

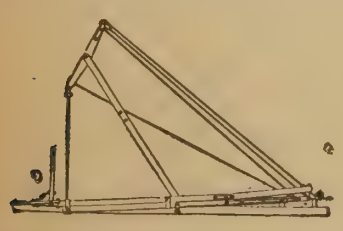


do not trample them on the next round.

(International Harvester Co., Chicago, Ill. U. S. Patent, 1,319,488.)

Corn Knife

This knife is designed for topping and cutting corn. It is strapped to the wrist at the butt, bears against



the side of the palm, and is held by means of the loop handle as shown.

(Roy Walker, Hardingsburg, Ky. U. S. Patent, 1,279,047.)

Hay Stacker

The new feature of this stacker is that the frame holding the fork is short when the fork is down, but gradually lengthens as the fork is raised. The shorter frame at the be-

ginning of the lift decreases the power needed to lift the hay to a given height.

(Dain Mfg. Co., Ottumwa, Iowa, U. S. Patent, 1,318,789.)

Hens Need Fresh Air for Winter Health

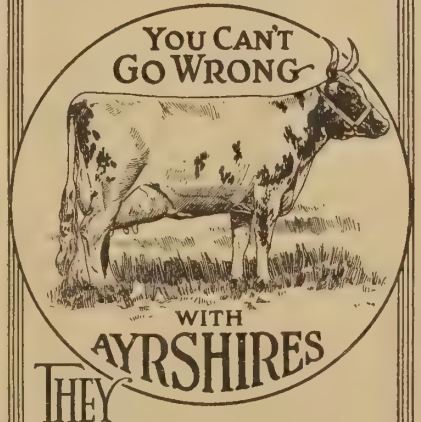
"More chickens are lost each winter from over-crowding and poor ventilation than from any other cause with the exception of some contagious diseases," says J. B. Hayes of the poultry department of the University of Wisconsin.

"Most people have the impression that all doors and windows must be closed in winter to keep the chickens warm but this is a mistake.

"A draft nine times out of ten will cause a chicken to catch cold, but fresh air alone never will. Their feathers were made to keep them warm. To avoid a direct draft muslin cloth should be placed in the open windows. This prevents the wind from blowing directly into the chicken house," says Mr. Hayes.

"The muslin windows should be placed above the level of the hens so that no possible draft can reach them from below.

"A well designed house should have one square foot of muslin for 15 square feet of floor space and one square foot of glass for each 10 square feet of floor space. Each chicken should be allowed about four square feet of floor area.



"There are ventilating systems on the market, but they have no marked advantage over the muslin cloth system which is very inexpensive," says Mr. Hayes.

"By facing the house to the south it can be kept very comfortable in winter. The roof may be as low as seven feet in the front and slant to the rear leaving no excess space to be heated."

When you see some of the unattractive farm houses on otherwise up-to-date farms, you hardly wonder that the boys and girls have gone to the city.

Uncle Ab says: "One of the best reasons for makin' a good farm is to rouse a spirit of competition in the fellows on the other side of your line fence."

He is offered for sale for immediate delivery. Guaranteed a breeder and right in every way. Price $2,000.
A. Henry Higginson
South Lincoln, Mass.

Economy in Production ← GUERNSEYS → Quality of Products

Advanced Registry tests on Guernsey cows increased by almost 50% in 1920 over 1919. The increase in testing resulted in the discovery of more high producing Guernseys than has been discovered in any preceding year. For more than 100 years, production has been consistently bred into the breed, until to-day each Guernsey cow can not help but be a big producer. Write for our free literature.

THE AMERICAN GUERNSEY CATTLE CLUB, Box H20, Peterboro, N H.

Herd under Federal Supervision.

Far Hills, Somerset Co., N. J.

Meadowland Guernseys

Sixty-five females, priced conservatively, are offered from which to make selections.

MEADOWLAND FARM, Litchfield, Conn.

Bull Buying Factors

The life of a bull in any herd is limited because of the hesitancy of inbreeding.

No matter why you want to buy a bull at the present time the following two conditions concern you above all others in making your purchase.

1. **You want to follow certain blood lines.**
2. **You want the best you can get in these lines for the amount you are going to spend.**

THE HOARD'S DAIRYMAN FARM is now offering for sale four bull calves, all of serviceable age. These calves are of May Rose descent. **Anton's King Confidence 43517** is their sire. He traces **six times** to the foundation cow of the **May Rose** family. His ancestors represent a select few of the best animals of the Guernsey breed. His individuality is of the "carry on" type and he stamps his offspring in a remarkable manner. The dams of these bull calves are some of the best cows in the herd and the kind we delight in showing our visitors.

The prices of these calves range from $275 to $350, easily within the reach of the dairy farmer who realizes the value of good breeding and outstanding individuality.

If you are interested write us about these young fellows.

Hoard's Dairyman Farm
Fort Atkinson - - Wisconsin

Just What You Want!

An 8 months old bull calf. Partly white, light fawn, very fine individual.

SIRE—Cream Cup's King Regent of Allenwood 33889, by Allenwood King Regent 23641 and Allenwood Cream Cup 41291 who has a record of 436.89 lbs. fat Class G.

Handling Milk Utensils

"While the solution of the problem of producing milk of low germ content," say Professors Prucha and Harding of the Illinois College of Agriculture in Bulletin 230, "lies largely within the province of the milk plant operator, the fact remains that under present conditions, a large part of the cans returned to the producer from the milk plant are in a moist condition. Accordingly it is important to know what the milk producer can do with these moist, high germ content cans in order to prepare them for receiving milk. Moreover, the problem of the most effective and at the same time the most practical method of handling pails and similar utensils is one constantly present on all farms.

"The mechanical washing of pails and cans is both simple and ordinarily so well done as to need little comment. Following this washing, there is much divergence of practice with regard to subsequent rinsing of the washed utensils. A large part of the effect of such rinsing upon the germ life has been found to result from the mechanical removal of the germs by the rinse water. Experimental treatment of a considerable number of well washed eight-gallon cans suggests that the treatment is capable of removing from a can more than two billion germs.

"A somewhat larger number of germs as mechanically removed by using warm rinse water but as the temperature of the rinse water increased, the measurement of the germs actually removed was complicated by the destructive action of the hot water upon the germs. The destructive effect of hot rinse water upon germ life was found to be much less than is commonly supposed, owing to the rapid cooling of the rinse water through the transfer of its heat to the utensil. Thus, when an eight gallon can at 72°F. is rinsed with a quart of water at 150°F., the temperature of the rinse water falls about 40° within 60 seconds. As the amount of rinse water per can is increased, the drop in temperature is correspondingly reduced. When 4 quarts of water at 150 degrees F. are added to a can, the temperature drops only about 20 degrees.

"When boiling water was applied to the utensils in these experiments the destruction of germ life was pronounced, particularly when more than two quarts of rinse water were used per can. Under such circumstances the combined effect of the mechanical removal and the destruction of germ life was such that if the cans had been immediately filled with sterile milk, the germs remaining in such scalded cans would commonly have increased the germ content of the milk only about 100 bacteria per cc. Accordingly the fairly common practice of applying boiling water to freshly washed utensils or to moist, washed cans returned from the milk plant is to be commended. It should be noted, however, that the pouring of this rinse water from one can to another greatly reduces the effectiveness of the practice, both because the rinse water promptly becomes too cool to exert much killing effect, and because it quickly becomes contaminated by the germ life which it mechanically removes from the utensils.

"As a method of treating the moist washed cans which arrive at the farm shortly before they are needed, nothing better is available ordinarily than the thorough rinsing of the cans with boiling water. However, when any considerable interval is to elapse before the cans are filled with milk, it is of prime importance that they be promptly and thoroughly dried.

"Observations were made upon the effect of inverting washed and rinsed cans on a rack in the sun. When the sun was hot and the air dry, the cans dried quickly and the germ life in them was promptly reduced. Cans which were only fairly well rinsed, when thus dried and kept dry were ordinarily in a condition to add not more than 100 bacteria per cc. to the milk with which they might have been filled. However, during damp or rainy weather, when moisture remained in the cans, the germ content held its own or even multiplied considerably.

"A further series of observations were made in the laboratory by adding to sterile cans 10 cc. of water from a vat of rinse or wash water, and holding the cans for twenty-four hours, one-half of the cans with their covers on and the other half with the covers removed. In the cans on which the covers were retained, the germ life increased between 20 and 3,000 fold. In the cans from which the covers were removed, and conditions permitted rapid drying, the germ content fell promptly, but when the drying was retarded the amount of germ life remained constant or even increased.

"A thorough drying of the cans before they leave the milk plant will exert a profound influence upon the germ content of the milk later returned to the plant in these cans; but when the cans are returned to the producer in moist condition, he may put them into acceptable condition by thoroughly rinsing them with boiling water, and then promptly and thoroughly drying them if they are not to be used immediately."

A YEARLY RECORD BULL

Our 85 Yearly Record Cows and Heifers Average 753.49 Lbs. Butter and 17,525 Lbs. Milk

We can quote you on young bulls out of cows with good seven-day records and with semi-official records of from 600 to 1,000 lbs. Our prices range from $400 to $3,500.

These Calves are Sired By —

—King of the Ormsbys His dam, his dam's dam, and his full sister all have semi-official records above 1,000 lbs. His own dam has four records above 30 lbs. in 7 days and three above 1,000 lbs. in 365 days.

—King of the Sadie Vales His dam is a 38-lb. cow and both of his grandams are 41-lb. cows. His three, four, six, nine, and twelve nearest dams average over 31 lbs. in 7 days.

—Johanna King Segis His sire is a yearly record son of King Segis, and his dam is a 40-lb. cow — the first cow to produce over 500 lbs. butter in 120 days.

—Sir Inka Prilly Segis He is a 30-lb. son of King Segis. He has 20 daughters with semi-official records, and 15 are now on test.

If a saving of from $100 to $500 on a bull means anything to you, then write for our new price list which shows pedigrees of the bulls we have for sale.

King Pietertje Ormsby Piebe 24th was born July 2, '20, a show calf if there ever was one.
He is by King Pietertje Ormsby Piebe, that famous son of Queen Piebe Mercedes, world record daughter of S. P. O. M.
His dam, Rose King Mutual, a daughter of King Mutual Korndyke, made 22.3 lbs. in 7 days and 681 lbs. in a year at 24 months. Her dam, a 1,045-lb. 4-year-old.
His 3 nearest dams average 1,038 lbs. butter in a year, 2 as 4-year-olds, his dam as a 2-year-old.
We offer him on easy terms of payment

KING PIETERTJE ORMSBY PIEBE 24th

Hargrove & Arnold Norwalk, Iowa
Herd Under Federal Supervision

If you think the height of the Holstein industry has been reached

You're Wrong

It is Yet to Come

Did you know that only two per cent of the dairy cattle in the United States are pure-breds?
It is astounding when you think of it and have these figures before you:
The average cow here in Minnesota produces about 4,000 lbs. of milk in a year (the same average would no doubt apply to the entire United States).
We have thirty cows in our herd that have averaged over 20,000 lbs. of milk per year for the past three years, or an income of over $100.00 per month, for every one of these cows.
Why keep the scrub? It costs just as much, and you will never have the same interest in your herd, that you will have in pure-breds.
Take a paper and pencil and figure it out for yourself.
This is the buyers' market — there never was a time when you could fill your barns as advantageously as now—why don't you do it?
A few months from now, prices will be soaring — and a bird in the hand is worth two in the bush.
If men in other lines of business had as much to brag about as we have — they would do limitless advertising and boosting.
We believe in boosting. Do you?

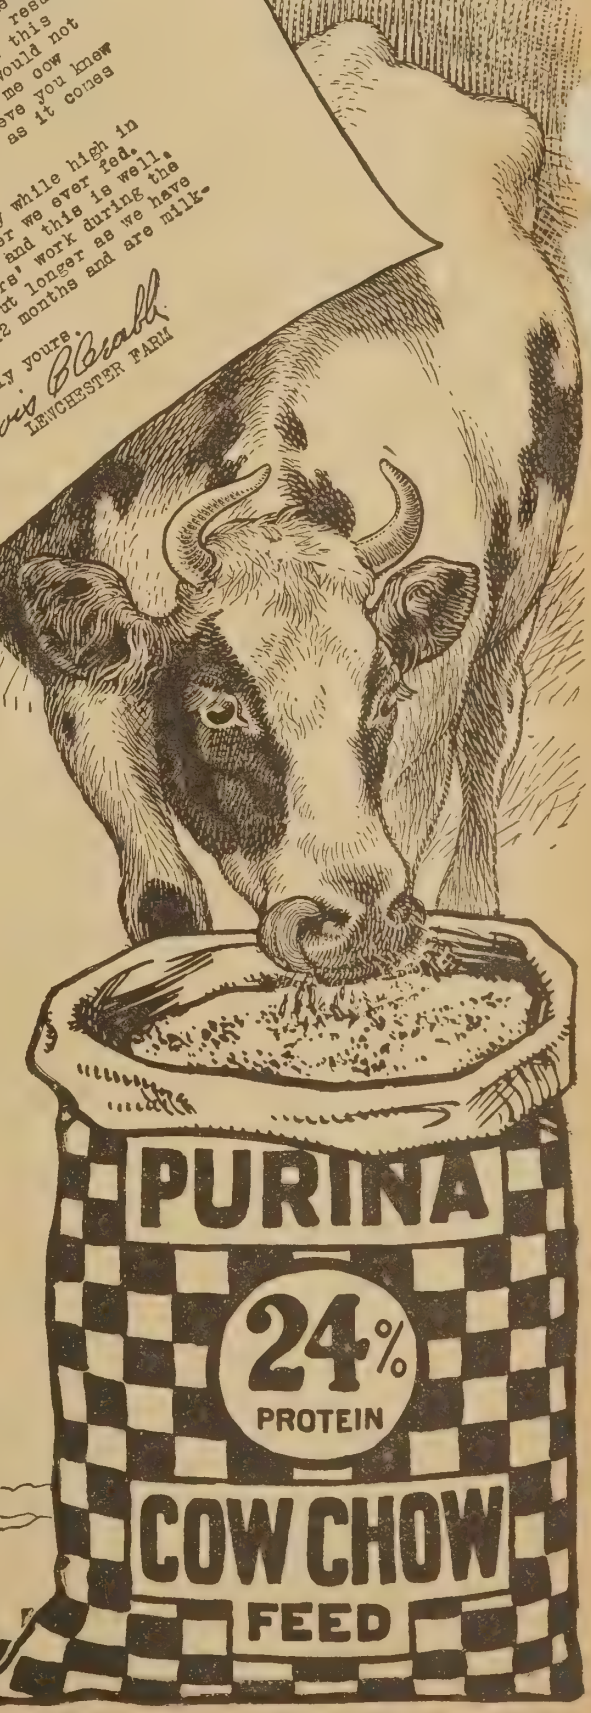
Mr. H. E. Ritchey,
Purina Mills,
Ft. Worth, Texas.



Dear Mr. Ritchey:

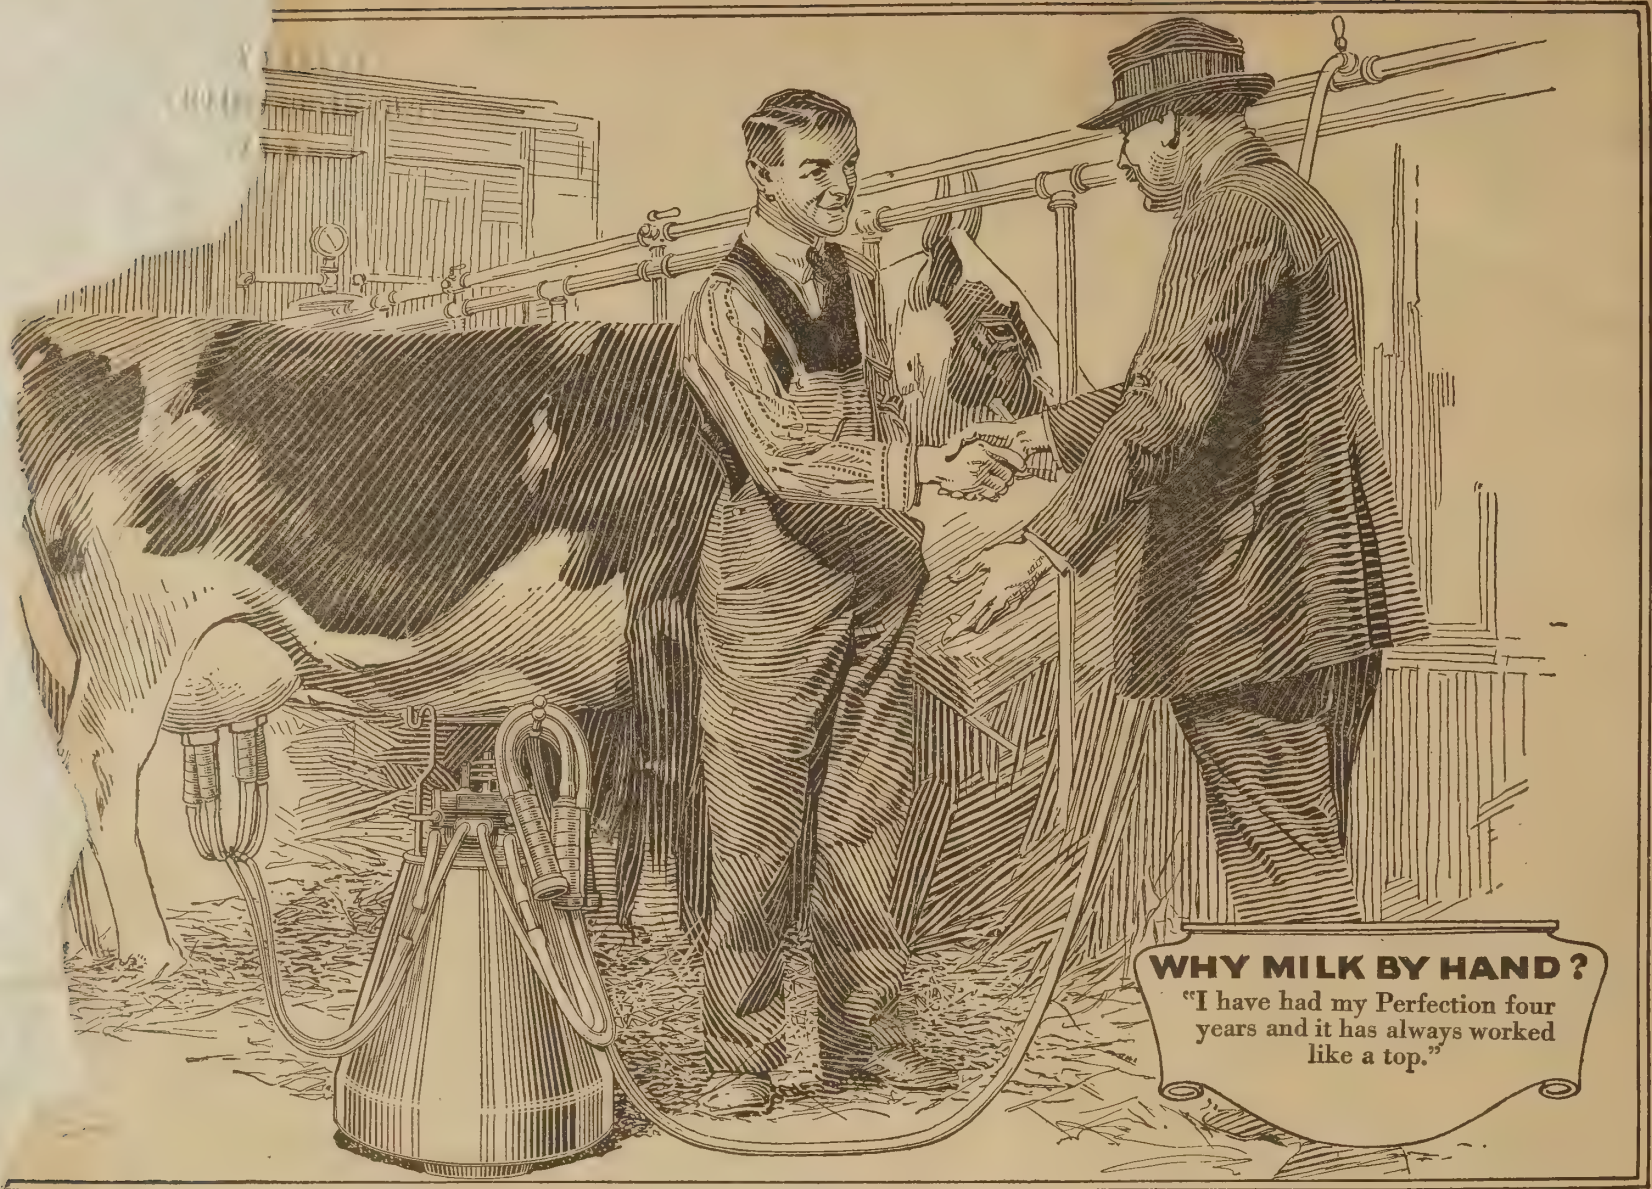
You might be interested to know that to date, I have made every state record, held by Holstein cattle in Texas, and have the distinctive honor of owning a cow that has produced 100 lbs. of milk a day for 100 days and made the first and only 30-lb. record ever made in the state, and your great cow ohow did it.

At first I tried to mix my own ration using other grains with it but this did not give me the results I felt that I should have, and the feeding question caused me to lose considerable sleep and finally was becoming somewhat despondent, when a man of quite a varied experience in feeding told me, "Lewis find what the cow likes and feed her that." The country was safe then for me for I felt that I knew that the cow likes a 30-lb. record right off the reel, and had I done this earlier in the testing season the 30-lb. record would not have been alone now. So I now know as you told me ohow is made right in the mills and now I believe you knew whether you ever fed a cow or not. I feed it as it comes from the mills from this time on.

As a regular ration I will say while high in price I find it the cheapest milk producer we ever fed. Our cows are making around 40 lbs. each and this is well at least 10 lbs. over their former years' work during the month of July, and they are holding out longer as we have some that are now in milk for over 12 months and are milking over 40 lbs.

Very truly yours,
Lewis C. Crabb
LEWCHESTER FARM

When he remembered that cows like Cow Chow



he recalled the first essential of a good dairy ration. But, it must be remembered also, that the palatability of Purina Cow Chow comes from putting into it, pure Cuban molasses, sprayed hot on the correct balance of elements that properly nourish the cow. Cows never tire of Cow Chow because they like best this palatable ration that supplies them with *the materials they need* for bodily maintenance and milk production.

Whether you sell milk or record-breaking milk cows, you should feed Purina Cow Chow. See your dealer.

Purina Cow Chow

"I was the first one to install a Perfection Milker in this vicinity and now I understand there are 115 Perfections around here." —EDGAR L. CLASON.

You'll Always Be Glad You Got A Perfection

YOU'LL wonder how you ever got along without it, and wouldn't dream of going back to hand milking. That is what any Perfection owner will tell you when he congratulates you on your choice of the Perfection Milker.

There are many reasons why you will be delighted with your Perfection. It wins your cows from the start. Cows like the Perfection because it is nature's way of milking. The gentle suction followed by a downward squeeze, followed by a period of rest is just like the calf's way of milking.

Dairymen who have used the Perfection for years have found it pays for itself in less than a year in savings on wages. They are delighted in relief from drudgery. Thev know the Perfection gets more milk.

Just such satisfied owners as they have made possible 115 Perfections in one neighborhood—a tribute to a better way of milking. Get a Perfection and you will always be satisfied with your choice.

Let Us Send Booklet

We have a copy of the book, "What the Dairyman Wants to Know" waiting your name and address. Write today! We'll also send the names and addresses of Perfection owners near you. Why Milk By Hand? Users unanimously endorse Perfection.
